alum (al'um), *n* [Early mod E often *allum*, *alum*, *alym*, *< ME allum, alom, < OF. alum, mod F. alun = MHG. alūn, G. alun (> Pol. alun (barred)), Sloven. alun = Russ. gālnū = Lath. alunas), < L. alumen, alum, of unknown origin.] The general name of a class of double sulphates formed by the union of aluminum, iron, chromium, or manganese sulphate with the sulphate of some other metal, commonly an alkaline metal or ammonium. Common or potash alum has the formula $Al_2(SO_4)_3 \cdot k \cdot SO_4 + 24H_2O$. It is produced by mixing concentrated solutions of potassium sulphate and crude aluminum sulphate. The double salt at once crystallizes in octahedrons. Alum is soluble in water, has a sweetish sour taste, reddens litmus, and is a powerful astringent. In medicine it is used internally as an astringent, externally as a styptic applied to severed blood vessels. In the arts it is used as a mordant in dyeing, and extensively in other ways. When mixed in small amount with inferior grades of flour, it is said to whiten them in the process of bread making, but its effect on the system is injurious. **Alum shale**, an other name for *alum slate*, including especially its more shaly varieties. **Alum slate**, a variety of clay slate containing more or less carbonaceous material (remains of seaweeds, etc.), with which is associated an easily decomposed and frequently occurring compound of sulphur and iron (maurascite). The decomposition of this substance gives rise to an efflorescence of alum, usually potash alum, which is a compound of potassium sulphate and aluminum sulphate. — **Burnt alum**, alum from which the water of crystallization has been driven off by heat. Also called *dried alum*, *alumen exsiccatum*. — **Concentrated alum**, normal aluminum sulphate, $Al_2(SO_4)_3$, which is prepared on a large scale by treating roasted clay with oil of vitriol, and crystallizing out the sulphate formed. It is largely used in dyeing. Also called *potent alum*. — **Cubic alum**, or **basic alum**, the mineral alum stone. — **Earth of alum**. See *earth*. — **Roman alum**, a variety of potash alum prepared from the mineral alum stone, of special value to dyers, since it contains no soluble iron salts. Also called *rock alum* and *roche alum*.*

alum (al'um), *v. t.* [*< alum, n.*] To steep in or impregnate with a solution of alum.

It is widely diffused over the globe in the shape of clay, loam, and other similar substances, corundum, in its varieties adamantine spar, the ruby, and sapphire, is aluminum nearly pure and crystallized. In these forms alumina is, next to the diamond, the hardest substance known. Its great value in the arts depends on its affinity for vegetable coloring matters and animal fiber. It forms the base of the lakes in dyeing and acts also as a mordant. United with silica it is extensively used in the manufacture of all kinds of pottery and porcelain ware, crucibles, mortar, and cements.

aluminate (a-lū'mi-nāt), *v. t.*, pret. and pp. *aluminated*, ppr. *aluminating* [*< L. aluminatus, pp. adj., < alumen (alumin-) see alum*] To treat or impregnate with alum, specifically, in printing engravings, to wash (the paper) with alum-water to prevent the running of the lines.

aluminium (al-ū'mi-n'um), *n* [*NL (> F. alumin, > E. alumen), < L. alumen (alumin-), alum (see alum), + -um, as in sodium, potassium, etc., first proposed by Davy in the form aluminum and then aluminium. It was discovered by Wöhler*] Chemical symbol Al; atomic weight 27.1. A metal of silver-white color and brilliant luster, about as hard as zinc, very malleable and ductile, highly sonorous, and a good conductor of heat and electricity. Its most remarkable character is its low specific gravity (2.56), which is about one third that of iron and less than that of marble. It does not tarnish in the air, and even in a molten state does not oxidize; its melting point is somewhat lower than that of silver. Aluminium in combination with oxygen (Al_2O_3) forms the mineral corundum, which exists in nature as the mineral corundum, of which the ruby, sapphire, and emerald are varieties, the hydrate of sesquioxide exists as the minerals diaspore, gibbsite, and bauxite. Alumina also enters into the composition of a very large number of minerals, the most important of which are the feldspars. From the decomposition of these, clay (kaolin, etc.) is produced, which is essentially a hydrated silicate of aluminum. Among other important minerals containing aluminium are the silicates andalusite, cyanite, fibrolite, topaz, and all of the zeolites, the fluorid of aluminium and sodium cryolite, from which the metal is reduced, the oxide of aluminium and magnesium, spinel, the sulphates aluminite, alum stone, the alums, etc., the phosphates turquoise, lazulite, etc., the carbonate dawsonite, and many others. It is estimated that in its various compounds aluminium forms about one twelfth of the crust of the earth. In consequence of its very low specific gravity, freedom from tarnish, non-poisonous qualities, and ease of working, aluminium is a valuable metal. The use of aluminium has extended with the rapid decrease, through improved processes, in the cost of separating it from the combinations in which it occurs in nature. It is used especially for physical apparatus and other articles in which lightness and great strength are necessary. The cap of the Washington monument, which forms the tip of its lightning rod, is a pyramidal mass of aluminium weighing 100 ounces. Also written *aluminum*. — **Aluminium bronze**, an alloy of 9 parts of copper with 1 of aluminium. It resembles gold in luster and color, and is used as a cheap imitation of that metal. Unlike gold, however, it gradually tarnishes on exposure to the air. It is much used in cheap jewelry and ornamental work, and also for a great variety of industrial purposes, especially for bearings in machinery. — **Aluminium silver**, a

But as the AS and other forms are glossed by the various Latin names *amphora*, *lagena*, *uricus*, *cadus*, *batus*, *stula*, *hydria*, etc., the sense 'one-handled' does not seem to be original, and the spelling may have been corrupted to suit the popular etymology, the real source being then *L amphora*, a two-handled vessel see *amphora*. The OHG *em-bar*, so developed as 'one-handled,' would naturally be followed by *zür-bar*, 'two-handled?'] 1 A vessel with one handle, a pail, a bucket, a pitcher. — 2 An old English measure of 4 bushels.

2 A mineralized pale-yellow, sometimes reddish or brownish, resin of extinct pine-trees, occurring in beds of lignite and in alluvial soils, but found in greatest abundance on the shores of the Baltic, between Königsberg and Memel, where it is thrown up by the sea. It is a hard, translucent, brittle substance, having a specific gravity of 1.07. It is without taste or smell, except when heated. It then emits a fragrant odor. Its most remarkable quality is its capability of becoming negatively electric by friction. Indeed, the word *electricity* is derived from the Greek for *amber* *ἤλεκτρον*. It sometimes contains remains of extinct species of insects. It yields by distillation an empyreumatic oil consisting of a mixture of hydrocarbons and succinic acid. It is now used chiefly for the mouth-pieces of pipes and for beads, and in the arts for amber varnish. In mineralogy it is called *succinite*. Artificial *amber* is for the most part copalony.

3 In the English versions of the Old Testament (Exod 1 4, 27, viii 2) used to translate the Hebrew word *chashmal*, a shining metal, rendered in the Septuagint *ἤλεκτρον*, and in the Vulgate *electrum*. See *electrum*. — 4 Liquid-amber. — Acid of *amber*. Same as *succinic acid*. — Black *amber*, jet. — Fat *amber*, a valuable opaque *amber*, in color resembling a lemon. — Oil of *amber*, a volatile oil distilled from *amber*. When pure it is a colorless limpid liquid having a strong acid odor and burning taste. It is somewhat used in medicine as a stimulant and antispasmodic. — Sweet *amber*, a popular name of a European species of St John's wort, *Hypericum Androsaemum*. — White *amber*, spermaceti.

It is the muscle formerly known as the *gracilis* muscle of birds, but its identity with the mammalian *gracilis* is questionable. Most birds, as the entire order *Passeres*, have no ambiens. The presence or absence of the muscle has lately been made a basis of the division of birds into two primary series in Gaurd's classification, birds having it being termed *Homalognatæ*, those lacking it *Anomalognatæ*. See these words

The ambiens arises from the pelvis about the acetabulum, and passes along the inner side of the thigh, its tendon runs over the convexity of the knee to the outer side, and ends by connecting with the flexor digitorum perforatus. When this arrangement obtains, the result is that when a bird goes to roost, and squats on its perch, the toes automatically clasp the perch by the strain upon the ambiens that ensues as soon as the leg is bent upon the thigh, and the tarsus upon the leg, the weight of the bird thus holding it fast upon its perch

ambulacra, *n.* Plural of *ambulacrum*

ambulacral (am-bū-lā'krāl), *a.* [*ambulacrum* + *-al*] Of or pertaining to an ambulacrum, or to the ambulacra, of an echinoderm—**Ambulacral face**, **ambulacral aspect**, that surface of an echinoderm which bears the ambulacra, corresponding in a starfish to the oral aspect, that upon which the creature creeps—**Ambulacral groove**, a furrow which marks the course of an ambulacrum.

[In a starfish] a deep furrow, the *ambulacral groove*, occupies the middle of the oral surface of each ray, and is nearly filled by contractile sucker-like pedicels, apparently arranged in four longitudinal series.

Huxley, *Anat. Invert.*, p. 475

Ambulacral metameres, the divisions of the body of an echinoderm as marked or determined by the ambulacral system, as the five fingers or rays of a starfish. See extract under *ambulacral vessels* and cut under *Astrophyton*—**Ambulacral nerve**, a nerve which is in relation with the ambulacra.

When the suckers of an ambulacrum [of a starfish] are cut away, a longitudinal ridge is seen to lie at the bottom of the groove between their bases. This ridge is the *ambulacral nerve*. Followed to the apex of the ray it ends upon the eye and its tentacle, in the opposite direction, it reaches the oral disk.

Huxley, *Anat. Invert.*, p. 478

Ambulacral neural canal, a tube of which the ambulacral nerve forms the outer wall—**Ambulacral ossicle**, one of a double row of small hard plates which come to gather in the ambulacral groove, extending from its sides to its middle line. Also called *vertebral ossicle*. See cut under *Asteroida*—**Ambulacral plate**, one of those coronal plates of a sea urchin which are perforated to form part of an ambulacrum. See cut under *ambulacrum*.

In the ordinary Echinus or sea urchin of these plates there are twenty principal longitudinal series, constituting the great mass of the corona, and ten single plates, which form a ring around its aboral or apical margin. The twenty series of longitudinal plates are disposed in ten double series—five ambulacral and five interambulacral. Each *ambulacral plate* is subdivided by a greater or less number of sutures into a corresponding number of minor plates, called pore plates.

Huxley, *Anat. Invert.*, p. 486

Ambulacral sac, in echinoderms, that portion of the vasoperitoneal sac of the embryo which lays the foundation for the whole system of the ambulacral vessels. See *vasoperitoneal* and *Holothuroidea*—**Ambulacral system**, the water vascular system (which see, under *water vascular*).

lar) of echinoderms—**Ambulacral vesicle**, a sac situated upon the aboral face of an ambulacral ossicle—**Ambulacral vessels**, the water vascular channels of the ambulacra. See cut under *Echinoderma*.

Another marked peculiarity of the Echinoderm type is the general, if not universal, presence of a system of *ambulacral vessels*, consisting of a circular canal around the mouth, whence canals usually arise and follow the middle line of each of the ambulacral metameres.

Huxley, *Anat. Invert.*, p. 4

Circumoral ambulacral vessel, that into which a radial canal of the ambulacral system of vessels opens at its oral end—**Radial ambulacral vessels**, those which radiate from the central or circular vessel which surrounds the gullet.

Ambulacraria (am'bū-lak-rā'ri-a), *n.* pl [NL, < *ambulacrum* + *-aria*] 1 A branch or subkingdom of animals, constituted by the Echinodermata and Enterozoa, and divided into Radiata and Bilateralia, the latter represented by the genus *Balanoglossus* alone. *Mechnikoff*—2† [*l*] The coronal ambulacra of sea-urchins.

Ambulacrata (am'bū-lak-rā'ta), *n.* pl [NL, neut. pl of *ambulacratus*, < *ambulacrum*] A term applied by E. R. Lankester to a branch of echinoderms consisting of the *Holothuroidea*, *Echinoidea*, and *Isteroidea*, or sea-cucumbers, sea-urchins, and starfishes, as collectively distinguished from the crinoids or *Tentaculata* (which see).

ambulacriform (am-bū-lak'ri-fōrm), *a.* [*L* *ambulacrum* + *forma*, form] Possessing the form or appearance of an ambulacrum.

alley, < *ambulare* see *ambulate*] In zoöl, a row, series, or other set of perforations in the shell of an echinoderm, as a sea-urchin or starfish, through which are protruded and withdrawn the tube-feet or pedicels. Each such row or set of holes usually forms a narrow grooved line from base to apex of a sea urchin, and from the center to the end of each ray of a starfish, along the oral aspect of the body. Each set or radiating series of perforations is an ambulacrum, the several rows together being the ambulacraria. The usual definition of ambulacra as the perforated spaces through which the tube feet are protruded leaves a doubt whether an ambulacrum is not such perforated space. *Ambulacraria* is sometimes used for the tube feet themselves, collectively, in which case it properly signifies several sets or series of tube feet, not several tube feet of any single row or series.

The *ambulacraria* present important variations in the three divisions of the Echinodermata. *Huxley*, *Anat. Invert.*, p. 480

Ametabola (am-e-tab'ō-lā), *n. pl.* [NL, < Gr *αμεταβολος*, unchangeable see *ametabolous*] In *zool*, insects which do not undergo metamorphosis. In Macleay's system of classification, a term borrowed from W. E. Leach to designate a subclass of *Insecta* by which the myriapodous, thysanurous, and anoplous "insects" should be collectively contrasted with the true insects, which undergo metamorphosis. Myriapoda being excluded from the class *Insecta*, and *Insecta* being classed with insects that are not thoroughly ametabolous, *Ametabola* is by some authors restricted to the collembolous and thysanurous insects. The term is correlated with *Hemimetabola* and with *Metabola*.

M. Leach has formed them [Myriapoda] into two orders, Chilopoda and Chilognatha raising them, together with the two other orders, Thysanura and Anoplura (or Parasita, Latr.), and certain annulated worms, into a distinct class, to which he applied the name of *Ametabola*, which Leach had proposed only for the spring tailed insects and lice. Amen was always represented in human form, and was of a much higher order than the ram-headed divinity the god of life worshiped especially at the famous oracular sanctuary of the Libyan oasis of Ammon (now Siwah). The latter type was confused by the Greeks and Romans with that of Amen-Ra and was adopted by them as *Zeus Ammon* or *Jupiter Ammon* but in art was generally idealized so that only the horns sometimes with the ears of the ram were retained springing from a human head

ammonia (a-mô-ni-â), *n* [*< NL (Bergmann, 1782), < L (sal) ammoniacum* see *ammoniac*]

1 The modern name of the volatile alkali, NH₃, formerly so called to distinguish it from the more fixed alkalis. It is a colorless gas, very soluble in water, having a pungent and suffocating smell, and a transient alkaline effect on vegetable colors. It can be liquefied by pressure and frozen by a mixture of solid carbonic acid and ether in a vacuum. Its density is only about half that of atmospheric air. It is a strong base and forms a great number of salts which are isomorphous with those of potassium and exhibit a close analogy to them. It is found in minute quantity in air, and is a natural product of the decay of animal substances. It is procured artificially by the destructive distillation of nitrogenous organic matters such as bones, hair, horns, and hoofs, and is largely obtained as a by-product in the manufacture of illuminating gas from coal. Ammonia is used very largely in medicine and the arts, chiefly in solution in water under the name of *liquor ammoniac*, *aquosus ammoniac*, or *spiritus hartshorn*. (See *aqua ammoniac* under *aqua*) Among the more important salts of ammonia is ammonium chloride or sal ammoniac, NH₄Cl which formerly was the source from which all ammonium salts were prepared. It is largely used in dyeing, and in soldering and tinning. At present ammonium sulphate, (NH₄)₂SO₄, is the starting point for the manufacture of ammonium salts, being made in large quantity from gas liquor. It is also used as a fertilizer. There are several ammonium carbonates. The commercial article, called *sal volatile*, is a mixture of hydrogen ammonium carbonate and ammonium carbonate. See *ammonium*

It is used as an expectorant and as a stimulant in certain phlegmas. The so-called gum ammoniac from Morocco (which is with little doubt the *ammoniacum* of the ancients) is of uncertain origin, but is probably obtained from some species of *Taocetum*. ammonium (a-mon-ī-um), *n* [**< NL** (Berzelius, 1804) *< ammonia* + *-um*] A name given to the hypothetical base (NH₄) of ammonia, analogous to a metal, as potassium. It has not been isolated. If mercury at the negative pole of a galvanic battery is placed in contact with a solution of ammonia or ammonium chloride and the current is completed the mass swells to many times its former volume and an amalgam is formed which at the temperature of 70° or 80° F. is of the consistency of butter but at the freezing point is a firm and crystallized mass. This amalgam is supposed to be formed by the metallic base ammonium and is the nearest approach to its isolation. On the cessation of the current the ammonium decomposes into mercury, ammonia and hydrogen; the two latter escaping as gas in the proportions expressed by their atomic weights, namely, H and NH₃. **Ammonium bases**, compounds representing one or more molecules of ammonium hydrate, in which monatomic or polyatomic radicals replace the whole or part of the hydrogen as seen in tetraethyl ammonium iodide, N(C₂H₅)₄I.

The subfamily includes many small fresh water species, of which a large number inhabit the streams and pools of the United States.

An amnion is developed in those vertebrates only which have a fully formed allantois. In man it is absent in the *Lithopoda* or fishes and amphibians, but present in all *Saccolipoda* or reptiles and birds, and in *Mammalia*. The amnion is formed at a very early period in the life of the embryo, by a duplication of the placental or external blastodermic membrane, which carrying with it a layer of mesoderm from the somatopleuric division of the latter, rises on all sides about the embryo, the folds of which coming together over the back of the embryo, and there closing to form a shunt sac, in which the embryo is inclosed from this mode of growth, it is obvious that what was the outer side of the amniotic folds becomes the inner side of the sac when it has shut, so that the plialastic layer is internal, the mesodermic external, the process of invagination being comparable to that by which in the case of the primitive, trace of the embryo, a layer of plialastic is converted into the lining of the spinal canal. Only that fold of membrane which is next the body of the embryo com-

poses the amnion proper, the other or outer fold in contact with the enveloping primitive chorion (vitelline membrane or yolk sac) either disappearing or taking part in the formation of the permanent chorion. As long as this outer fold is recognizable as a membrane, it bears the name of *falsæ amnion*. The shunt sac of the amnion contains the liquor amni, a bland, albuminous, serous fluid in which the fetus is immersed. In parturition, rupture of the sac is followed by the bursting of the waters. Some times a portion of the sac adheres to the head of the child, fitting like a skull cap, such an infant is said, in the language of midwives, who commonly regard the circumstance as a good omen, to be "born with a caul." père, < *ampère*, name of a French electrician (André Marie Ampère, died 1846) [cf *ohm* and *volt*] The unit employed in measuring the strength of an electrical current. It is the current which flows through a conductor whose resistance is one ohm, and between the two ends of which the unit difference of potentials (one volt) is maintained. As defined by the International Electrical Congress of 1893 and by a United States statute of 1890, it is one tenth of the unit of current of the continuous or direct current system of electromagnetic units and is represented in practice by the millivolt, current which, when passed through a standard solution of nitrate of silver in water, deposits silver at the rate of 0.001118 of a gram per second.

ampere-meter (am-pi'r-mē'tēr), *n*. In *elect.*, an instrument for measuring the strength of an electric current in amperes.

Several forms have been devised, some of which are essentially self-maintaining, specially constructed for this purpose. Another form (see the cut) consists of a hollow coil of wire traversed by the current to be measured, which, according to its strength, draws within itself a core supported by a spring and having an index attached to it, the scale is so graduated that the strength of the current is given directly in amperes. Also called *ammeter*, *ammeter*.

[cap.] In *zool.*, a name variously used. (a) In the Linnaean system (1760), the third class of *Animalia* including all *Reptilia*, *Batrachia*, and various fishes and fish-like vertebrates. It was divided into three orders: (1) reptiles furnished with feet and breathing by the mouth (*Petard*, *Draco*, *Lacerta*, *Rana*), (2) footless serpents, also breathing by the mouth (*Crotalus*, *Boa*, *Coleus*, *Anax*, *Amphisbaena*, *Cecilia*), (3) finned swimmers (*Nautica*, *pinna*) breathing by lateral branchiae or gills, comprising 14 genera of fishes and fish-like vertebrates as the *Marsipobranchia* and *Squali*. (b) In Cuvier's system (1817) a tribe of carnivorans mammals intervening between *Carnivora* and *Marsupialia*, containing the seals and walrus, or plimiped *Caracaras* — thus exactly equivalent to the *Pinipedia* of modern naturalists. Cuvier had earlier (about 1799) placed the *Amphibia* next to the *Cetacea*, both comprising mammals with feet adapted for swimming, as distinguished from those with claws or with hoofs. (c) A class of Ichthyopsidan vertebrates, corresponding to the order *Batrachia* of Brongniart and Cuvier, containing animals that breathe both in the water and in the air at the same or at different periods of their lives, and have either permanent gills or gills later superseded by lungs, or gills and lungs simultaneously. The gills are usually external. Respiration is also usually effected to some extent by the skin. Limbs are either present or absent, and there are no fins in the adult. The *Amphibia* undergo metamorphosis, the larval forms being more or less fish-like, the adult developing limbs. They are anamniotic and amniotic, oviparous and cold-blooded. The heart has two auricles and one ventricle. The skull is dicondylar with an unossified basal occipital and a parapschond. The *Amphibia* have been very generally called *Batrachia*, after Cuvier, but the latter term is now usually restricted to an order *Batrachia* of the class *Amphibia*. The *Amphibia* include all the animals commonly called frogs, toads, newts, efts, tritons, salamanders, etc., as well as the *Amphibia* which are divided into *Anura* and *Urodela* the tailless and tailed *Amphibia*. A more elaborate division is into four orders: (1) *Ophiomorpha* or *Gymnomorpha* including only the family *Ceciliidae*. (2) *Urodela*. (3) *Batrachia*. (4) the fossil *Labyrinthodontia*.

amule (am'ūl), *n.* Same as *amyl*²

amulet (am'ū-let), *n.* [Formerly also *amulette*, late ME *amulette*, *amlette*, < F *amulette* = Sp. Pg. *amuleto* = D. G. *amulet*, etc.]

amulet = Russ. *amuletko*, etc., < L *amuletum* (in Pliny), a word of unknown origin.] Some object superstitiously worn as a remedy for or preservative against disease, bad luck, accidents, witchcraft, etc.

Amulets have been used from ancient times, and are still worn in many parts of the world. They consist of certain stones, or plants, or of bits of metal, parchment, or paper, with or without mystic characters or words.

The gospel and saints' relics have been used in this way. The Mohammedans use diminutive copies of the Koran hung around the neck. From the heathen and the Jews the custom passed into the primitive Christian church, where it was long maintained in spite of the decrees of ecclesiastical councils and the protests of the more intelligent clergy.

Amulets of various forms have been found in the catacombs, many of them inscribed with the word *ichthys*, fish, because this represented the initials of the Greek words for Jesus Christ, Son of God Saviour. (See *ichthys*.) They were used as pendants from the neck or affixed to some part of the body.

See *phylactery*, 3 = Syn. *Amulet*, *Talisman*. An amulet is supposed to exert a constant protecting power, warding off evil. A *talisman*, to produce under special conditions desired results for the owner.

= Syn. 3 *Amuse*, *Divert*, *Entertain*, *Regle*, occupy, please, enliven. *Amuse* may imply merely the prevention of the dullness of idleness or emptiness of mind, as, I can amuse myself by looking out at the window, or it may suggest a stronger interest, as, I was greatly amused by their tricks.

Divert is to turn the attention aside, and (in the use considered here) to something light or trifling. *Entertain* is to engage and sustain the attention by something of a pleasing and perhaps instructive character, as conversation. Hence the general name *entertainment* for lectures, exhibitions, etc., designed to interest in this way.

Whatever *amuses* serves to kill time, to lull the faculties and banish reflection. It may be solitary, sedentary, and lifeless whatever *diverts* causes mirth and provokes laughter, it will be active, lively, and tumultuous what ever *entertains* acts on the senses and awakens the understanding. It must be rational and is mostly social.

Crabb *Regle* is, figuratively, to cheat one out of weariness, of dull time, etc. The word is as often thus applied to the thing as to the person, as, to *be* *amused* a weary hour, to *be* *amused* one of his cares.

an, *a* (an, ā, or an, ā) [*< ME an, before a vowel, occasionally before a consonant, a, before a consonant (see a²), < AS ān, an, with the reg. adj. declension in sing and pl (pl āne, some, certain), and the same word as an, one, its use as an indef. art. being comparatively rare. When so used, it was without emphasis, and became in ME short in quantity (hence E short an, ā), while the numeral an, retaining its emphasis and quantity, developed reg into E one, pronounced on (as in only, at-one, at-one), in modern times corrupted to won and finally to win. see one*] The indefinite article. As between the two forms of this word, the general rule is that *an* be used before an initial vowel sound of the following word, and *a* before an initial consonant sound. Thus, *an eagle, an answer, also an hour* (the *h* being silent), *a bird, a youth, a wonder, also a use, a eulogy, a one* (these three words being pronounced as if they began with *no* or *u*). But *an* is still sometimes used before a consonant sound, especially before the weak consonant *h* and in written style, and in more formal spoken style, *an* is by many (especially in England) required before the initial *h* of a wholly unaccented syllable as if such an *h* were always silent. Thus, *an hotel, but a hostess, an historian, but a history, an hypothesis, but a hypothetical*. In colloquial speech, and increasingly in writing, *a* is used in all these cases alike. As by its derivation, so also in meaning *an* or *a* is a weaker or less distinct one. (1) In certain phrases, and with certain nouns, it still has nearly the value of one. Thus, two of a trade, they were both of a size, a hundred a thousand, a million. (2) Usually as the indefinite article proper, it points out in a loose way an individual as one of a class containing more of the same kind. Thus, give me a pint of milk. He ate an apple. They built a house. We see a man, the earth has a moon, on sun a fixed star. (3) Hence, before a proper noun it implies extension of the name or character of the individual to a class. Thus, he is a Cicero in eloquence. They built up a new England in America. That is a person like Cicero, a country like England. (4) It is used, apparently, before a plural noun at first or many (now only *great many* or *good many*) stands between. Thus *a few apples, a great many soldiers*. But the plural noun is here historically a genitive putative dependent on *the many*. (5) It is used distributively, or with the meaning of each or every. In such phrases as two dollars a piece, three times a day, five cents an ounce, but *a* or *an* is here historically a preposition. See *a¹*. *An* or *a* always precedes the noun to which it belongs, and in general also any other adjective word qualifying the same noun, but *what* and *such* come before it. Thus *what a shame!* *such a beauty*, and so also any adjective preceded by *how*, or *so* or *as* or *too*. Thus *how great a calamity*, *so rare a case*, *as good a man*, *too early a death*. *Many* is a phrase of peculiar meaning. See *many*.

an (an, ān), *conj*. [A reduced form of *and*, existing from the earliest ME. period, and often then so written, but in modern literature *an* for *and* copulative is admitted only in repetitions of dialectal or 'vulgar' speech and is then usually printed *an'*. In conversation, however, though not in formal speech, the *d* is generally dropped, especially before a word beginning with a consonant, and the vowel may be weakened to the point of vanishing. *An'* for *and*, it, is archaic in literature, and is generally printed *an*, in distinction from and copulative.] *I.* Coordinate use. And, same as *and*, *A*. Good is quoth Joseph, to dune of win (wine). Hellence an blisse is thir In *Genius and Exodus*, 1 2067. *An* makes him quite forget his labor an his toil Burns, *Cottar's Saturday Night*. *II.* Conditional use. If, same as *and*, *B*. And mygte kysse the kyng for cosyn, an she wold In *Piers Plowman* (B), ll. 132. *An* thou wert my father, as thou art but my brother Beau and Fl., *Custom of the Country*, i. 1. *An* I may hide my face, let me play Tishy too Shak., *M. N. D.*, i. 2. Why, *an* you were to go now to I lod Hall, I an certain the old lady wouldn't know you Sheridan, *The Rivals*, ill. 4.

an (an, ān), *prep*. [ME *an*, < AS *an*, the orig. form of the usual AS, ME, and mod E *on*, as a prefix *an-*, usually *on-*, in reduced form, *a*, prefix *a-*, see *on*, *an*, *a¹*, *a²*] An earlier form of *on*, retained until the last century in certain phrases, as *an edge, an end*, now only *on edge, on end*, in present use only as an unfelt prefix *an-* or reduced *a-*. See *an*, *a¹*.

The name is best known historically as applied to the followers of Thomas Muncie, leader of the peasants war in Germany, who was killed in battle in 1525, and to those of John Matthys and John Bokkold or John of Leyden who committed great excesses while attempting to establish a socialist kingdom of New Zion at Mount Zion at Munster in Westphalia, and were defeated in 1555, their leaders being killed and hung up in a cage which are still preserved in that city. The name has also been applied to bodies of very different character in other respects, probably always in an obnoxious sense since believers in the sole validity of adult baptism refuse to regard it as rebaptism in the case of persons who had received the rite in infancy. It is now most frequently used of the Mennonites. See *Mennonite*

It is divided by Günther into 4 *pleuronectoides* characterized by having the two sides of the head asymmetrical and compressible, the flatfishes of the family *Pleuronectidae*, and 4 *gadoides* having the head symmetrical. By later writers it has been restricted to the forms manifesting bilateral symmetry. assumed as true, and consequences are drawn from it until something conceded is reached, which if it is true involves the truth of the thing sought, the demonstration corresponding to the *analysis*, in the latter the construction sought is assumed as already known and consequences are deduced from it until something given is reached

2 In the *Kantian logic*, explanatory, involving a mere analysis or explication of knowledge, and not any material addition to it

In all judgments in which there is a relation between subject and predicate (I speak of affirmative judgments only the application to negative ones being easy), that relation can be of two kinds. Either the predicate B belongs to the subject A as something contained (though covertly) in the concept A, or B lies outside of the sphere of the concept A though somehow connected with it. In the former case I call the judgment *analytical*. In the latter, *synthetical*. *Analytical* judgments (affirmative) are therefore those in which the connection of the predicate with the subject is conceived through identity while others in which that connection is conceived without identity may be called *synthetic*

3 In *philol*, deficient in inflections, and employing instead particles and auxiliary words to express modifications of meaning and to show the relations of words in a sentence as, an *analytic language*—*Analytical chemistry*, a method of physical research in which compound substances are resolved into their elements *Analytical definition* See *definition* *Analytical geometry*, geometry treated by means of ordinary algebra with a reference, direct or indirect to a system of coordinates See *coordinate* In ordinary rectangular coordinates for example, there is just one point of space for every set of values of the three variables x, y, z . If, now, an equation is assumed between these variables some of the sets of otherwise possible values will be excluded, and thus some of the points of space will be denied to us, and we shall be restricted to a certain locus or place and since the number of independent variables is in consequence of the equation, reduced by one, the number of dimensions of the locus at any one point will be one less than that of space, so that the locus will be a surface By the use of such equations of loci every problem of geometry is reduced to a problem of algebra and the whole doctrine of geometry is mathematically identified with the algebra of three variables Thus to discover that when four equations subsist between three unknown quantities, they can be satisfied simultaneously, amounts to discovering that when a certain geometrical relation subsists between four surfaces, they meet in a common point The idea of analytical geometry was exclusively due to the genius of Descartes (1596-1650) who published his *Geometrie*, containing illustrations of the new method, in 1636 *Analytical jurisprudence*, a theory and system of jurisprudence wrought out neither by inquiring for ethical principles or the dictates of the sentiment of justice, nor for the rules which may be actually in force but by analyzing, classifying, and comparing various legal conceptions The best known of the analytical jurists are Bentham and

 the ground under water by means of a cable

Anchors are generally made of iron and con-
 sist of a strong shank *a*, at one extremity of
 which is the crown *c*, from which branch out
 two arms *b b*, curved in-
 ward, and each termi-
 nating in a broad palm
 or fluke *d d*, the sharp
 extremity of which is
 the palm or bill At the
 other end of the shank
 is the stock *e e*, a trans-
 verse piece, behind which is a shackle or ring to which a ca-
 ble may be attached The principal use of the stock, which
 in nearly all anchors is now made of iron and is placed at
 right angles to the curved arms *b b* is to cause the arms to
 fall so that one of the flukes shall enter the ground Accord-
 ing to the various forms and uses, anchors are called *star*
board bower *port* bower *sheet*, *spare*, *stream*, *kedg*, and
grapnel or *boat* anchors The starboard and port
 bowers, on the starboard and port bows respec-
 tively, the *sheet*, on either side of the ship
 further aft, and the *spare* anchor, which is
 usually in the hold These are all of equal
 or nearly equal size and weight To these are
 added for various pur-
 poses the *stream* and
kedg anchors, which
 are smaller and of var-
 ious sizes Many im-
 provements and novelties in the shape and construction of
 anchors have been introduced in recent times The prin-
 cipal names connected with these alterations are those of
 Lieut Rodgers, who introduced the *hollow shanked anchor*
 with the view of increasing the strength without adding
 to the weight, Mr Porter, who made the arms and flukes
 movable by pivoting them to the shank instead of fixing
 them immovably, causing the anchor to take a wider and
 firmer hold, and avoiding the danger
 of fouling the ca-
 ble, Mr Trotman,
 who has further im-
 proved Porter's in-
 vention, and Mr
 Martin, whose an-
 chor is of very pecu-
 liar form, and is con-
 structed so as to be

self canting, the arms revolving through an angle of 30
 either way, and the sharp points of the flukes being always
 ready to enter the ground Of the many other forms, all

self canting, the arms revolving through an angle of 30
 either way, and the sharp points of the flukes being always
 ready to enter the ground Of the many other forms, all

(except Tyzack's anchor, which has only one arm, pivoted
 on a bifurcation of the shank and arranged to swing be-
 tween the two parts) are more or less closely related to the
 forms illustrated The anchor is said to be a *cockbill* when
 it is suspended vertically from the cathead ready to be let
 go *apack* when the cable is drawn in so tight as to bring
 it directly under the ship *atrap* or *catch* when it is just
 drawn out of the ground in a perpendicular direction,

A word connecting a word, phrase, clause, or sentence with that which precedes it a colorless particle without an exact synonym in English, but expressed approximately by 'with, along with, together with, besides, also, moreover,' the elements connected being grammatically coordinate

In our last conflict four of his five wits went halting off, and now is the whole man governed with one

Shak., Much Ado, I. 1.

We have been up and down to seek him
Shak, M. of V, III 1
His fame and fate shall be
An echo and a light unto eternity
Shilley, Adonais, I 8
Along the heath and near his favourite tree
Gray, Elegy, I 110

When many words, phrases, clauses, or sentences are connected, the connective is now generally omitted before all except the last, unless retained for rhetorical effect. The connected elements are sometimes identical, expressing continuous repetition either definitely, as, to walk two and two, or indefinitely, as, for ever and ever, to wait years and years.

To-morrow and to-morrow, and to-morrow,
(Creeps in this petty pace from day to day,
To the last syllable of recorded time

Shak, Macbeth, v 5

The repetition often implies a difference of quality under the same name, as, there are dragons and dragons (that is according to the proverb, "There's odds in dragons"), there are novels and novels (that is, all sorts of novels). To make the connection distinctly inclusive, the term *both* precedes the first member, as, both in England and in France. For this, by a Latinism, *and* has been sometimes used in poetry (Latin and French cf. (f)).

or drums exposed to the wind, and so arranged as to yield to its pressure and indicate the amount by their movements

Linds's anemometer consists of a glass tube bent into the form of an inverted siphon graduated partly filled with water, and mounted on a weathercock. To one of its open ends a metallic cylinder of the same bore as the tube is attached at right angles. The pressure of the wind blowing into this causes the water to sink in one arm of the tube and to rise in the other, and the difference of level of the two columns of water, which is measured by the amount of fall plus the amount of rise, as shown by the graduated scale, gives the force or pressure of the wind. By the use of mechanical or electrical appliances anemometers may be made to record as well as measure variations in the velocity and pressure of the wind. When they record the velocity or direction, or both, they are sometimes called *anemographs*, when they indicate the direction only, they are called *anemographs*, when they automatically record velocity, direction, and pressure, they are called *anemographs* or *anemotro-graphic registers*

= **Syn.** *Anger*, *Wrath*, *Indignation*, *Resentment*, *Wrath*, *Irre*, *Choler*, *Rage*, *Fury*, passion, displeasure, indignation, irritation, gall, bile, spleen. *Wrath* is the least forcible of these words, expressing the annoyance and impatient chiding of one whose mood has been crossed whose expectations have not been realized, etc. *Indignation* may be the most high minded and unselfish. It is intense feeling, in view of grossly unworthy conduct, whether toward one self or toward others. The other words denote almost exclusively feeling excited by the sense of personal injury. *Anger* is a sudden violent feeling of displeasure over injury, disobedience, etc., accompanied by a retaliatory impulse. It easily becomes excessive, and its manifestation is generally accompanied by a loss of self control. *Resentment* is the broadest in its meaning, denoting the instinctive and proper recoil of feeling when one is injured, and often a deep and bitter brooding over past wrongs, with a consequent hatred and settled desire for vengeance. It is, in the latter sense, the coolest and most permanent of these feelings. *Wrath* and *irre* express sudden feeling of great power, and are often associated with the notion of the superiority of the person, as the *wrath* of Jove, the *irre* of Achilles. They are often the result of wounded pride. *Irre* is poetic. *Wrath* has also an exalted sense expressive of a lofty indignation visiting justice upon wrong doing. *Rage* is an outburst of anger, with little or no self control, *fury* is even more violent than *rage*, rising almost to madness. The chief characteristic of *choler* is quickness to rise, it is irascibility, easily breaking into a high degree of resentful feeling.

A. Brooke*, F. W. Robertson, II. ii

Several of the English scholars who are most active in the study of early English were on *Anglo-Saxon* They attack the word They are still more hostile to the suggestion which goes with the word, that the speech called *Anglo-Saxon* is different from modern English, so as to deserve a separate name They say there has been but one speech spoken in England by the Teutonic tribes and their descendants from Cædmon to Tennyson This classic *Anglo-Saxon* differs from our English in phonology, in vocabulary, in inflections, in the derivation of words, in syntax, in versification (see *alliteration*) and in the modes of thought The former is a synthetic Germanic speech, with its own periods of early irregular inflection, classic cultivation decline and fall into dialects, the latter an analytic mixed speech of Romanic cultivation, with other periods of growth and classic regularity and progress And a chaos separates the two languages It is only when attention is directed to the history of etymological forms that unity can be plausibly claimed for them But while the importance of these forms in tracing the descent of languages is probably not overrated, their weight in establishing identity or affinity may easily be The proposed use of *Old English* [in place of *Anglo-Saxon*] does not distinguish but can founds all the periods of *Anglo-Saxon* and the two early periods of English The reasons urged for this nomenclature are in great part sentimental It is thought to magnify the English language and race to represent

them as Low German, having an unbroken history parallel with that of the High German, and reaching through a more famous career to a more venerable antiquity. But Americans are taught to believe in mixed races, and it magnifies the English most in our eyes to represent it in the old fashion, as formed by the junction of two great languages, the bearers of the best cultivation of the Teutonic and Romanic races.

It was discovered in 1826 by Unkeler, as a product of the distillation of indigo, and called by him *crystallin*. It did not acquire commercial importance until 1856 when the purple dye mauve was prepared from it by Perkins. It is found in small quantities in coal tar, but the aniline of commerce is obtained from benzol, another product of coal tar, consisting of hydrogen and carbon, C_6H_6 . Benzol when acted on by nitric acid produces nitrobenzol and this latter substance when treated with nascent hydrogen, usually generated by the action of acetic acid upon iron filings or scrap, produces aniline, which is an oily liquid, colorless when pure, somewhat heavier than water, having a peculiar vinous smell and a burning taste. It is a strong base, and yields well characterized salts. When acted on by arsenic acid, potassium bichromate, stannic chloride, etc., aniline produces a great variety of compounds of very beautiful colors, known by the names of aniline purple, aniline green, violet, magenta, etc. Also called *anila*

Such functions may be grouped in a few broad classes: (1) Mentality, including all activities of the mind as distinguished from those of the body, such as instinct, reason, intellect, ideation, etc. (2) Sensibility, or feeling, the capability of responding automatically to external stimuli, irritability, innervation common to all animals in a high degree as compared with plants. (3) Locomotion usual in animals, but unusual in plants. (4) Nutrition involving material growth and waste and repair common to plants and animals, but usually differently effected in the two, and with different material. (5) Reproduction, or generation a process whereby growth is devoted to the formation of separate individuals. Functions shared by all or generalized in large are called *organic* or *vegetative* functions, no functions are peculiar to animals except those of mentality. Other lesser categories of functions are sometimes named as the digestive function, the excretory function, the function of circulation, of respiration, the function of the liver, or of any part or organ, that is, the special part which it takes in the animal economy — **Animal heat**, the temperature maintained during life in an animal body, and requisite for its physiological functions. It varies from a degree not appreciably different from that of the element in which the animal lives to one much higher, the latter being the case with the higher animals. Difference in degree of animal heat is the ground of a division of the higher animals into warm blooded and cold blooded, *Hematotherms* and *Heterotherms*. In the former a very sensibly elevated temperature is maintained. It is highest in birds, amounting sometimes to 112 F. In mammals a usual range is from 98 to 104 F. In man the mean normal temperature is about 99, any considerable deviation from which is inconsistent with health. Animal heat is simply a case of chemical combustion, an analogous process goes on in plants. It is an index of the molecular motion of the body, and a measure of the work done by an animal in its vital activities — **Animal kingdom**, all animals collectively, *Animalia* one of the three grand divisions of the realm of nature (*imperium naturæ*), the other two comprising plants and minerals respectively. For scientific purposes it has been divided into classes or orders, families, genera, species and groups (with intermediate divisions often formed by prefixing *sub* or *super* to these words) whereby the classification and registration of animals are facilitated. Examples of the primary divisions are the following: (1) The Linnean system (1760) divided animals into 6 classes: I. *Mammalia*, II. *Aves*, III. *Amphibia*, IV. *Pisces*, V. *Insecta*, VI. *Vermes*. (2) The system of Cuvier (1817) proposed 4 subkingdoms and 20 classes: I. *Vertebrata* (*Mammalia*, *Aves*, *Reptilia*, *Pisces*), II. *Mollusca* (*Cephalopoda*, *Pteropoda*, *Gastropoda*, *Aciphalia*, *Brachiopoda*, *Cirrhopoda*), III. *Articulata* (*Annelula*, *Crustacea*, *Trilobita*, *Arachnida*, *Insecta*), IV. *Radiata* (*Echinodermata*, *Fusozoa*, *Ascidophora*, *Polysiphonia*, *Infusoria*). (3) The system of Owen (1860) separated the *Protozoa* from *Animalia* proper as a separate kingdom, the latter being then divided into subkingdom I. *Invertebrata*, with 3 provinces, *Radiata*, *Articulata*, *Mollusca* and subkingdom II. *Vertebrata*. (4) In 1869 Huxley arranged the animal kingdom in the 8 primary groups: I. *Vertebrata*, *Mollusca*, *Mollusca*, *Celebrata*, *Amphibia*, *Amphibia*, *Infusoria*, *Protozoa*. No two authorities agree upon the leading divisions of the animal kingdom, but a system like the following is now quite generally accepted: Subkingdom A (with one phylum), *Protozoa*, class I, *Rhizopoda*, class II, *Gregarina*, class III, *Infusoria*. Subkingdom B, *Metazoa*. Phylum 1, *Celebrata*, class IV, *Spongiata*, class V, *Hydrozoa*, class VI, *Actinozoa*, class VII, *Ctenozoa*. Phylum 2, *Echinodermata*, class VIII, *Ctenozoa*, class IX, *Asterozoa*, class X, *Echinodermata*, class XI, *Holothuridea*, Phylum 3, *Vermes*, class XII, *Plathelminthes*, class XIII, *Nemathelminthes*, class XIV, *Gephyrea*, class XV, *Annelida*, class XVI, *Rotifera*, Phylum 4, *Arthropoda*, class XVII, *Crustacea*, class XVIII, *Arachnida*, class XIX, *Myriapoda*, class XX, *Insecta*, Phylum 5, *Mollusca*, class XXI, *Polysiphonia*, class XXII, *Brachiopoda*, Phylum 6, *Mollusca*, class XXIII, *Aciphalia*, class XXIV, *Pteropoda*, Phylum 7, *Celebrata*, class XXV, *Fusozoa*, class XXVI, *Leptocardia*, class XXVII, *Margophranchia*, class XXVIII, *Plasmodobranchia*, class XXIX, *Reptilia*, class XXX, *Amphibia*, class XXXI, *Pisces*, class XXXII, *Aves*, class XXXIII, *Mammalia*. Three remarkable genera, *Dicynodon*, *Sauroia* and *Balanoglossus*, are severally regarded by many authors as types of classes — **Animal magnetism**, *mechanics*, etc. See the nouns — **Animal power**, the unit of power in men and animals, as *man power*, *horse power*, etc. Usually expressed in foot pounds. See *horse power* — **Animal spirits** (a) According to the doctrine of Galen, modified by Descartes, subtle and almost incorporeal parts of the living body, which penetrate the pores of the nerves and pass between the brain and the periphery, acting as the agents of volition and sensation. Also in the singular, *animal spirit*, equivalent to nervous force or action. (b) In modern use, exuberance of health and life, natural buoyancy, cheerfulness, animation, gaiety, and good humor

Animal spirits constitute the power of the present, and their seats are like the structure of a pyramid *Emerson, Society and Solitude*

II. *n* 1 A sentient living being, an individual, organized, animated, and sentient portion of matter, in *zoö*, one of the *Animalia*, a member of the animal kingdom as distinguished from a vegetable or a mineral. The distinction from the latter is sufficient consisting in organization, interstitial nutrition, vitality, and animation, but it is impossible to draw any line between all vegetables and all

animals. Any criteria which may be diagnostic in most instances fail of applicability to the lowest forms of animal and vegetable life, and no definition which has been attempted has been entirely successful. Most animals are locomotory as well as motile; most plants are fixed. Most animals exhibit distinct active and apparently conscious or voluntary movements in response to irritation, mechanical or other, most plants do not. Most animals feed upon other animals or upon plants, that is to say, upon organic matter; most plants, upon inorganic substances. Most animals have no cellulose in their composition, nitrogenous compounds prevailing, while cellulose is highly characteristic of plants. Most animals inhale oxygen and exhale carbon dioxide, the reverse of the usual process in plants, and few animals have chlorophyll, which is so generally present in plants. Animals have usually a digestive cavity and a nervous system, and are capable of certain manifestations of consciousness, sentience, and volition, which can be attributed to plants only by great latitude in the use of the terms. See also *extract*.

Ordinary animals not only possess conspicuous locomotive activity, but their parts readily alter their form or position when irritated. Their nutrition, consisting of other animals and of plants, is taken in the solid form into a digestive cavity. Traced down to their lowest terms, the series of plant forms gradually lose more and more of their distinctive vegetable features, while the series of animal forms part with more and more of their distinctive animal characters, and the two series converge to a common term. The most characteristic morphological peculiarity of the animal is the absence of any such cellulose investment [of the cells as plants possess]. The most characteristic physiological peculiarity of the animal is its want of power to manufacture protein out of simple compounds *Huxley, Anat. Invert., pp 43-47*

The working of iron and steel by hammering, bending, rolling, drawing, etc., tends to harden them and make them brittle, and the original properties are restored by annealing. Steel plates and dies for bank note printing and the like are annealed in a close box with iron filings or turnings, lime, or other substances, and are thus freed from carbon and reduced to pure soft iron, in which state they will readily take, under pressure, the finest engraving from a hardened plate or die. Annulida (a-nē'lī-dā), *n* *pl* [*NL (with single l after F. annulus, pp pl, ringed), prop. Annulida, < L. annellus, more correctly annulus, dim of annulus, a ring (see annulus), + -ida*] 1 The annelids or *Annulides*, a class of invertebrate animals, of the phylum *Arthropoda*, sometimes called the class of red-blooded worms. The body is composed of numerous (up to some 400) segments, somites, or metameres, and limbs are wanting or, if present, rudimentary and consist of the claws or setae known as parapodia. A vascular system with red blood is usually present. The integument is soft, and composed of many layers the surface being mostly ciliated, or setose, the head is wanting or rudimentary, and in the latter case consists of a prostomium which may be ciliated or tentaculiferous. The *Annulida* are the "worms" properly so called, of which the common earthworm, loolworm, and leech are characteristic examples. Most of the species are aquatic and marine. The class is difficultly limited by different authors, the principal variation among later writers, however, being in excluding or including the *Gephyrea*. Excluding these, as is done by the above definition, the *Annulida* have been divided into four orders: (1) *Hydradinea*, *Dicophora*, or *Suctorina*, the leeches; (2) *Oligochaeta*, *Abranchia*, *Terricola*, etc., the earthworms and their immediate allies; (3) *Ctenopoda*, *Polychaeta*, *Errantia*, etc., the free sea worms; and (4) *Cephalobranchia*, *Tubicola*, etc., the tubicolous sea worms. Another scheme divides *Annulida* into four subclasses: (1) *Archannulida* composed of the genus *Polydora* and its allies; (2) *Ctenopoda* including (3), (4), and (4) of the foregoing schedule; (3) *Hydradinea* or *Dicophora*; and (4) *Euterochaeta*, consisting of the genus *Balanoglossus* which some authorities class with the scudicans or *Chordata*.

2 In Huxley's system (1877), a superordinal division including the *Polychaeta*, *Oligochaeta*, *Hydradinea*, and *Gephyrea*, with the *Myzostomata* doubtfully added thereto a group the members of which resemble one another generally in the segmentation of the body indicated at least by the serially multigauglionate nervous centers (wanting in most *Gephyrea*) in the

presence of cilia and segmental organs, and in the nature of the larvae, which are set free when the embryos hatch.

4 In logic, the term used since Cicero (Latin *anticipatio*) to translate the "prolepsis" (πρόληψις) of the Epicureans and Stoics. It denotes a general notion considered as resulting from the action of memory upon experiences more or less similar. Such a notion is called an anticipation because once possessed it is called up in its entirety by a mere suggestion. It thus acquaints us with what has not yet been perceived, by a reference to past perceptions. Hence with later philosophers, the word denotes knowledge drawn from the mind, independent of experience, the knowledge of axioms or first principles. With Bacon an anticipation of nature is a hasty generalization or hypothesis opposed to an interpretation of nature. In Kant's philosophy, anticipation is the a priori knowledge that every sensation must have degrees of intensive quantity

Antilope (an-ti-lō-pē), *n* [*< NL, see antelope*] I. A genus of *Antilopina* (which see)

The term has been used with such latitude in its application to the whole of the group *Antilopina*, and when restricted has been employed in so many different senses that it has lost whatever exact meaning it may have possessed originally, and has become a loose, confusing synonym of the subfamily name *Antilopina*. Even in early usage, it appears to have been applied to several different small gazel-like antelopes. It is now commonly restricted to the genus or Indian antelope *Antilope cervicapra*. See cut under *Antilope* 2† (an-ti-lōp). [*< L*] Obsolete (English) spelling of *antelope*

Antilopidae (an-ti-lō-pī-dē), *n pl* [*< NL, < Antilope + -idae*] A family of ruminants, the antelopes, sometimes used as a synonym of *Antilopina*. Also written *Antilopida*

Antilopine (an-ti-lō-pī-nē), *n pl* [*< NL, < Antilope + -ina*] A subfamily of old-world and chiefly African ruminants, the antelopes, a group belonging to the family *Bovidae*. They differ from cattle in their smaller size, more lithe and graceful form, slenderer legs which are comparatively longer in the shank, and longer neck with slender vertebrae, uplifting the head. The *Antilopina* shade directly into the sheep and goats (*Ovis* and *Capra*) being separable from them by their thickened chamois, but the horns usually differ from the forms presented by goats and sheep, though they are so diverse as to be identified by no common character. *Antilopina* are especially numerous in species and individuals in Africa, of which continent they are the most characteristic animals. Upward of 50 African species have been described, the most numerous in Asia, and a few in Europe. Some 75 species are recognized by naturalists, but probably the number of genuine species is less than this. Several hundred different names, generic, specific, and vernacular have been applied to the so-called antelopes, and no authors except minor compilers are agreed upon the division of the group. The antelopes present the utmost diversity of stature, form and general appearance, ranging from the smallest and most delicate gazels, stibboks, and springboks to the bulky kudu, nyli gnu or bartoest, as large as a cow, horse, or stag, and including the singularly misshapen gnu (*Oryx capensis*). The Rocky Mountain goat (*Oreamnos montanus*), related to the Alpine chamois, *Rupicapra rupicapra*, and the goat, *Capra montanus*, another goat-like antelope, are also placed in this subfamily. The bullaloe or bontie antelopes in India the bartheb (*Acrotaphus casiana*), blebok (*A. alba*), and bontbok (*A. zeyheri*). Four horned antelopes belong to the genus *Tetracerus*. The phillanthia and oxycapra antelopes, the blawbok, dukker, etc., are placed in the genus *Cephalophus*. The stibboks are species of *Antelope*, the springbok, kudu, etc., belong to the genus *Oryx*, *Oryx capensis*, *Oryx capensis*, *Oryx capensis*, and the bartoest, *Oryx capensis*. The gazel is a large group, constituting the genus *Gazella* (or *Dorcus*) and others. They include the springbok (*Antidorcas cauratus*), and the Arabian and Syrian, as well as African. The whole of equine antelopes constitute the genus *Hippotragus*. The addax is *Addax nasomaculatus*. There are several species of *Oryx*, as *O. capensis*. The nyli gnu is *Antilope swinhonis*. The bartoest antelope (so called from the antelope on the sides) or the kudu bartoest, are species of *Antelope*, as *A. swinhonis*, *A. swinhonis*. The kudu is a large antelope with twisted horns (*Strepsiceros kudu*). The eland is *Oryx capensis*. The so-called saiga antelope is the type of a different family, *Saiga* (which see). The movement spread to some other States and a national party was organized but within about ten years it disappeared. Most of the Antimasons became Whigs. Its characteristic tenet was that freemasons ought to be excluded from public office because they would necessarily regard their obligations to the society more than their obligations to the state. Its principles were revived in a so-called American party organized in 1876.

Also written *antimenson*.

antimere (an-ti-mē), *n* [*< (Gr avri, against + mē, a part)*] In *biol*, a segment or division of the body in the direction of one of the secondary or transverse axes, all of which are at right angles to the primary or longitudinal axis.

When these axes are not differentiated in any way, all antimeres are alike, and are parts arranged around the longitudinal axis like the spokes and felloes of a wheel around the axis of the hub. A disposition preserved with much accuracy in many of the *Radiata*, among which, for example, the arms of a starfish, the tentacles of a sea anemone or coral animal, or the rows of ambulacra of a sea urchin are antimeres. Often, however, the transverse axes are differentiated, some being shorter, others longer, giving rise to sides as right and left, in the direction of the longer transverse axes, in which case right and left parts are antimeres. This constitutes bilateral symmetry. Parts which may be perceived to correspond at opposite poles of the other (shorter) transverse axes, constituting dorsolateral symmetry, are also antimeres but this condition is obscure. Likewise, again, parts along the primary longitudinal axis, or at its poles which may be observed or be conceived to constitute anteroposterior symmetry, are essentially antimere, but this condition like dorsolateral symmetry, is obscure, while the serial succession of like parts along the primary axis, as the rings of a worm, crustacean, or insect, and the double rings of a vertebrate is so marked that antimeres of this kind are not called antimeres but *metameres*, such are the ordinary segments, somites, arthromeres, or diarthromeres of any articulate or vertebrate animal. Antimere is therefore practically restricted to such radiating and bilateral parts as are more or less symmetrical with one another. See *individual*.

It melts at 480° (806° F) and volatilizes slowly at a red heat when melted in the air it oxidizes steadily, forming antimony trioxide, Sb_2O_3 . Antimony occurs uncombined in nature to a limited extent usually in granular or foliated masses often with a botryoidal or reniform surface. Many compounds of antimony are found in nature the most important of them being the sulphid, Sb_2S_3 , called gray antimony, antimony glance or stibnite. Dyscrasite is a compound of antimony and silver. There are also a number of minerals containing antimony sulphur, and lead (like jamesonite), or antimony sulphur and silver (like pyrrhotite or subysilver), or antimony sulphur and copper (like tetrahedrite). The oxisulphid kermesite or red antimony and the oxide cerivanite and stibiconite (antimony oxide) are also important minerals. Antimony has few uses in the arts, it enters, however, into a number of very valuable alloys, as type metal powder, Britannia metal, and Babbitt metal, and is used in medicine. Tartar emetic is the tartarate of antimony and potassium. James's powder is a mixture of oxide of antimony and phosphate of lime. — **Antimony vermilion**, a sulphid of antimony suggested but never used as a pigment. — **Argentine flowers of antimony**, the tetroxide of antimony. — **Arsenical antimony** See *allomonite*. — **Black antimony**, antimonious sulphid. — **Butter of antimony** See *butter*. — **Ceruse of antimony** See *ceruse*. — **Diaphoretic antimony**, a preparation chiefly consisting of potassium antimoniate, made by exposing the neutral antimoniate to the action of carbonic acid gas, or by decomposing pure antimony with potassium nitrate. Finally, as a phase of extreme Calvinism in English Puritan theology in the doctrine that the aims of the elect are so transfixed to Christ that they become his in his glorious and cease to be the transgressions of the actual sinner. The chief exponent of the second form of antinomianism was John Agricola (Germany, 1492-1546) the chief exponent of the third, Tobias (resp. D D) (England, 1600-1642). [Often with a capital]

the velvet affording a copious supply of blood to the rapidly enlarging osseous tissue When the antlers are full grown the vascular activity of the velvet ceases, a result more than fully facilitated by the development of the bone or bony part of the beam, which to some extent strangles the blood vessels The velvet then withers and shrivels, and peels off in shreds, or is rubbed off by the animal The horns of the American pronghorn and the reindeer are much as they are deciduous and grow in the manner just described but the vascular structures and otherwise like the horns of cattle In forming the tines of much branched antlers, as those of the stag, have special means In the first year the stag has only front and posterior antlers, called *brow* and *surmural*, in the second, a simple *antler* or *surmural* called *antler* in the case of American deer In the third, a longer *antler* with one branch the *brow antler* In the fourth, the *bez*, *bez*, in *bay antler*, in the fifth the *antler royal* is acquired after which the ends of the stags horns become more or less palmated, developing the *crown* or *surmural*, whence more or fewer points diverge in subsequent years The total number of 'points' counting all the tines may be ten The main stem of a branched antler is the *beam*, the branches, exclusive of the more points of the palmated part, are the *tines* The order of branching is different in different species In some the division is dichotomous throughout as in the milk deer of America In general the tines are offsets of a main beam The reindeer is remarkable for the great size of the brow antler, which is also usually much larger on one side than on the other The most palmated antlers are those of the European elk and of the American moose

anus (ā'nus), *n* [L, prob orig the same as *anus*, *anus*, a ring, see *annulus*] The termination of the digestive tube or alimentary canal, the end of the enteron of any animal, the orifice through which the refuse of digestion is voided. The anus is usually on a part of the body away from the mouth, but it is sometimes coincident with the latter. It is usually a circular orifice, provided with a sphincter arrangement by which it may be shut, but it is sometimes a cleft or chink, the direction of the axis of which distinguishes zoological groups: thus, it is longitudinal in turtles, and transverse in lizards and snakes. In many vertebrates and other animals the anus serves for the discharge of the excretion of the kidneys and of the products of the generative organs, as well as of the refuse of digestion. See *anal*.

-Syn. Indifference, Insensibility, Impassibility, Apathy, Stoicism, Unconcern. *Phlegm*, *Calmness*, torpor, coldness, coolness, unfeelingness, lethargy, immobility (See *flat* under *indifference*). *Indifference* denotes absence of feeling, passion, or desire toward a particular object as, *indifference* to pain or ridicule. *Apathy* commonly implies a general want of feeling, a couple to indifference in regard to anything due to want of interest or attention, as in the case of a depressed or sluggish intellect, or of extreme illness or affliction. *Insensibility* and *impassibility* suggest the lack of capacity for feeling or an absence of susceptibility, being qualities rather than states of mind. *Indifference* arising from *impassibility* is more particularly to internal, that arising from *insensibility* to external impressions, the former is, moreover, more profound and radical than the latter. *Indifference* may be an entirely proper state under the circumstances. *Insensibility* and *impassibility* are always at least to be pitied, *unconcern* is always and *indifference* some times blameworthy, as cold and selfish. *Stoicism* is a studied suppression of feeling, or the concealment especially of painful feeling by force of will. *Unconcern* is absence of solicitude (See *care*). *Phlegm* is most suggestive of physical temperament. It is a constitutional dullness or sluggishness as an inability of being aroused by anything. *Calmness* is a tranquillity resulting from the mastery of the will over passions and feelings that perhaps are strong and keen, and hence is always commendable.

2. A precept or rule expressed in few words, a detached sentence containing some important truth as, the *aphorisms* of Hippocrates, or of the civil law.

The three ancient commentators on Hippocrates have given the same definition of an *aphorism* i. e. 'a succinct saying, comprehending a complete statement, or a saying poor in expression, but rich in sentiment.

Fleming.

— **Syn.** *Aphorism*, *Axiom*, *Maxim*, *Precept*, *Dictum*, *Apotehism*, *Saying*, *Adage*, *Proverb*, *Truism*, *Byword*, *Saw*, all concern in expressing a pithy general proposition, usually in one short sentence, but the latter form is the less applicable to the names because. An *aphorism* is a truth, pointedly set forth, relating rather to speculative principles, ethics, or science than to practical matters, and forming a brief and succinct statement of a doctrine, thus, "Moderation is the silken string running through the pearl chain of all virtues," and "Malaria is caused by nature, not by remedies," are *aphorisms*. "If is short, and art is long," is from the first *aphorism* of Hippocrates. An *axiom* is a self-evident truth, and is therefore used as a basis for reasoning. "A straight line is the shortest distance between two points," is one of the *axioms* of mathematics. "The greater good is to be chosen before the less," is an *axiom* of morals. The number of axioms is necessarily limited, of aphorisms, on the other hand, is unlimited. A *maxim* is a truth which while not so definite and exact as a *maxim* is a truth rather to practical than to abstract truth, stating one of the fundamental rules of conduct, civil government, business policy, and the like, as it is a sound maxim that one should risk in speculation no more than he can afford to lose. It suggests a lesson more pointedly and directly than *aphorism* and differs from *apotehism* in that a *precept* is a direct injunction whereas a *maxim* is a mere statement of a truth from which a *precept* may be deduced. It would be a *precept* to say, "In speculation risk no more than you can afford to lose." A *dictum* is not a *precept*, but an opinion given with authority, as from superior knowledge, as, a *dictum* of the critics, a *dictum* of Carlyle. An *apotehism*, in common matters what an *aphorism* is in higher, is essentially a terse proposition that makes a vivid impression on the mind, thus, "In the adversity of our best friends we always find something that doth not displease us," this is called by Dean Swift a *maxim*, but is more properly an *apotehism*. "Heaven helps those that help themselves," and

"He who fights and runs away

May live to fight another day

(*Goldsmith*, Art of Poetry),

are *apotehisms*. A *maxim* is a lower grade of *apotehism*, each is likely to be found associated with the name of the author as, the *apotehisms* of Socrates, a *saying* of Poor Richard. Each is a felicitous expression current for its own sake, but deriving additional popularity from the celebrity of its author. "Helen is that saying true, One saweth, and another reapeth," John iv. 37, "The little and short sayings of wise and excellent men are of great value, like the dust of gold or the least sparks of the diamond," *Tillotson*. *Adage* and *proverb* are habitual sayings, generally of long standing embodying the common sense of mankind on ordinary subjects. The *adage* is often the more venerable by age and the more dignified in its character, as, "Necessity knows no law." A *saying* may easily become an *adage*. *Proverb* as used in the Bible is often a *saying* as, "Physician, heal thyself," Luke iv. 23, but in the mod-

ern sense proverb often appears in some concrete figurative and homely form as, "Too many cooks spoil the broth", "Every tub must stand on its own bottom". A truism is a truth too obvious to need explanation or proof, it is a word of relative application, what would be a truism to one might be an axiom or an aphorism to another. A byword is a cant term or phrase, in every one's mouth like a proverb, but applied in disparagement. Saw is a contemptuous term for an expression that is more common than wise, or for a trite or foolish saying reiterated to wearisomeness.

apochromatic (ap'ō-krō-mat'ik), *a* [*<* Gr *ἀπό*, from, + *χρῶμα* (τ), color, + *-ic*] An epithet descriptive of an improved form of lens devised by Professor Abbe of Jena, constructed of new kinds of glass which allow of a more perfect correction of chromatic and spherical aberration than has hitherto been possible. The kinds of glass employed are chiefly remarkable in that their dispersion for different parts of the spectrum is nearly proportional, hence a lens constructed of them is not subject to the limitation of an ordinary achromatic lens of being strikingly achromatic for two colors only. Another defect of ordinary lenses, that their spherical aberration is not corrected for all rays, is also largely overcome.

The elimination of these errors realizes an achromatism of higher order than has hitherto been attained. The objectives of this system may be therefore distinguished from achromatic lenses in the old sense of the word by the term *apochromatic*, and may be called *apochromatic objectives*.

Specifically—2 *Ecles* (a) A name given in the early church to various writings of uncertain origin and authority, regarded by some as inspired, but rejected by most authorities or believers. Such books were either works acknowledged to be useful and edifying, but not established as canonical, or else heretical writings absolutely rejected by the church (b) [*cap*] A collection of fourteen books subjoined to the canonical books of the Old Testament in the authorized version of the Bible, as originally issued, but now generally omitted. They do not exist in the Hebrew Bible but are found with others of the same character scattered through the Septuagint and Vulgate versions of the Old Testament. They are—First and Second Esdras (otherwise Third and Fourth Esdras), Tobit or Tobias, Judith, the Rest of Esther, Wisdom of Solomon, Ecclesiasticus, Baruch (as joined to Jeremiah), parts of Daniel (namely, Song of the Three Children, the History of Susanna, the Destruction of Bel and the Dragon), the Prayer of Manasses and First and Second Maccabees. Most of these are recognized by the Roman Catholic Church as fully canonical, though theologians of that church often distinguish them as deuterocanonical on the ground that their place in the canon was decided later than that of the other books limiting the name *Apocrypha* to the two (last) books of Esdras and the Prayer of Manasses and other books not in the above collection, namely Third and Fourth Maccabees, a book of Enoch an additional or 151st Psalm of David and thirteen Psalms of Solomon. With these sometimes are included certain pseudepi-

graphic books such as the Apocalypse of Baruch and the Assumption of Moses. The name *Apocrypha* is also occasionally made to embrace the Antilegomena of the New Testament. The Greek Church makes no distinction among the books contained in the Septuagint. In the Anglican and Lutheran churches, the *Apocrypha* are read for example of life and instruction of manners, but not for the establishing of any doctrine. See *antilegomena* and *deuterocanonical*

As time used, the word was a descriptive rather than a distinctive term (c) In Cuvier's system, a section of the malacocephalians, the name being applied to such forms as are destitute of ventral fins. The true cels symbranchiate cels, *Gymnodont*, typical *Apodonta*, and *Ammodontoda* were referred to this group (d) By various later writers the name was used as a distinctive ordinal name. By L. Muller the *Apodonta* and *Ammodontoda* were combined. By Gill in 1861, the order was restricted to the typical and symbranchiate cels, and later (1884) to the true cels, or teleost fishes with the intermaxillaries atrophied or lost, the supra-maxillaries lateral, and the body anguilliform and destitute of ventral fins. These characters are correlated with various others which justify the isolation. The principal families are the *Anguillidae*, *Ophichthidae*, and *Urolophidae*

2 A proceeding taken to reverse a decision by submitting it to the review of a higher authority as, an *appeal* to the house from a decision of the chair. In *law* (a) Sometimes used in the above general meaning, so as to include writs of error, certiorari, etc. (b) Strictly, the removal of a cause or suit from a lower to a higher tribunal, in order that the latter may revise, and, if it seems needful, reverse or amend, the decision of the former. In modern usage, an *appeal* implies not merely a preliminary objection but a proceeding for review after a decision has been rendered. As now used, it is a proceeding derived from the courts of equity. The mode of review at common law was formerly that to remove the cause, but only to bring up specific points or questions by writs of error. This was changed in England by the Judicature acts of 1874-5, and there is now one court of appeal for all cases. In Scotland the highest appellate court is the Court of Session. The judgments of both these courts may be appealed to the House of Lords. In the United States the appeal has been to a great extent substituted for the writ of error. The highest appellate courts are, for federal questions arising in either federal or state courts, the United States Supreme Court. For other questions, the supreme courts, courts of appeal, or courts of error of the various States, the practice being wholly regulated by statutes. (c) The

mode of procedure by which such removal is effected. (d) The right of removal to a higher court. (e) Formerly, a vindictive action at the suit of a party injured when the supposed criminal had been previously acquitted on an indictment or pardoned. The appellant raised an action (which had to be brought within a year) and demanded the punishment of the accused, who had to submit to a fresh trial by jury, or demand a trial by wager of battle. —Syn. *Value, Prize, Esteem, Estimate, Appreciate* *Value* and *estimate* commonly imply a comparison with a standard of commercial worth, as, to *value* a picture at so much, to *estimate* its value at so much. To *prize* is to value highly generally for other than pecuniary reasons, and suggesting the notion of reluctance to lose. Thus, we *prize* a book for its contents or associations, we *prize* a friend for his affection for us. To *esteem* is sometimes simply to think as, I *esteem* him a scoundrel, sometimes to value as, I *esteem* it lightly, sometimes to have a high opinion of or set a high value on as, I *esteem* him for his own sake. In its highest sense it implies moral approbation. *Estimating* is an act of computation or judgment and wholly without feeling or moral approbation as, to *estimate* the size of a room, the weight of a stone, the literary excellence of a book, the character of a person. (See *esteem*, *n.*, for comparison of corresponding nouns.) *Appreciate* is to set a just value on, it implies the use of wise judgment or delicate perception as, he *appreciated* the quality of the work. With this perception naturally goes a corresponding intellectual valuation and moral esteem as they know how to *appreciate* his worth. *Appreciate* often implies also that the thing, appreciated is likely to be overlooked or undervalued. It is commonly used of good things as, I *understand* his wickedness, I *realized* or *recognized* his folly, I *appreciated* his virtue or wisdom. Compare such phrases as an *appreciative* audience a few *appreciative* words, *appreciation* of merit.

pubescent, orange-colored fruit, of a rich aromatic flavor, the produce of a tree of the plum kind, *Prunus Armeniaca*, natural order *Rosaceae*. Its specific name is due to the belief that it is a native of Armenia, but it is now supposed to be of Chinese origin.

It grows wild in the Himalayas and Northwestern Provinces of India, where its fruit is gathered in great quantities. It was introduced into England in 1524, by the garden of Henry VIII. The tree rises to the height of from 15 to 20 and even 30 feet, and its flowers appear before its leaves. In cultivation it is often propagated by budding upon plum stocks. There is a considerable number of varieties some of them with sweet kernels which may be eaten like almonds. a priori (ā pri-ō'ri) [*i.*, from something prior or going before *ā* for *ab*, from, *priori*, abl. of *prior*, neut. *prīus*, preceding: see *prior*, *a*] From the former, from that which precedes, hence, from antecedent to consequent, from condition to conditioned, or from cause to effect. Since the fourteenth century, the phrase *demonstratio a priori* (first found in Albert of Saxony, died 1390) has been commonly employed, instead of the earlier expression *demonstratio propter quod*, to mean proof proceeding from causes or first principles: opposed to *demonstratio a posteriori*, or *de demonstratio quia*, which proceeds from effect to cause, and simply proves the fact without showing why it must be as it is. In the eighteenth century *de demonstratio a priori* was applied to reasoning from a given notion to the conditions which such notion involves. But since Kant, *a priori*, used as an adjective and frequently placed before the noun, has been applied to cognitions which, though they may come to us in experience, have their origin in the nature of the mind, and are independent of experience.

Demonstration is perfect, when it proceedeth from the proper cause to the effect, called of the schoolmen, *a priore*. — *Blundeville, Art. of Logike (1599), vi. 19.*

Thus when we argue from the ideas we have of immensity, eternity, necessity, existence, and the like, that such perfections can reside but in one being, and thence conclude that there can be but one supreme God, this is an argument *a priori*. — *Clarke*

General truths, which at the same time bear the character of an inward necessity, must be independent of experience — clear and certain by themselves. They are therefore called *a priori*, while that which is simply taken from experience is said to be, in ordinary parlance, known *a posteriori* or empirically only.

Kant, Critique of Pure Reason, tr. by Max Müller

As used in a psychological sense, knowledge *a posteriori* is a synonym for knowledge empirical, or from experience, and, consequently, is adventitious to the mind, as subsequent to and in consequence of, the exercise of its faculties of observation. Knowledge *a priori*, on the contrary, called likewise native, pure, or transcendental knowledge, embraces those principles which, as the condition of the exercise of its faculties of observation and thought, are, consequently, not the result of that exercise. True it is that chronologically considered, our *a priori* is not antecedent to our *a posteriori* knowledge, for the internal conditions of experience can only operate when an object of experience has been presented. — *Sir W. Hamilton*

sanctuary of any church, particularly if it presents a superficial resemblance to an apse in the stricter sense, in that it is at least approximately semicircular in plan, and vaulted — commonly equivalent to *chevet*, and applied to the altar extremity of a church, even if of rectangular plan and not vaulted, and including the apse-aisles, chapels, and any other adjunct to the ritual east end of a church. The apse in its origin was a characteristic feature of the ancient Roman basilica, in which it formed the raised tribunal for the court magistrates. The throne of the quaestor or presiding judge stood in the center of the choir of the apse. When the basilica became a Christian church, the throne was replaced by the high altar, which still occupies this position in Latin churches of the strict basilica type, and has regularly kept it in Oriental churches. Some types of church regularly have secondary apses in other positions than at the eastern end, as at the western end, at the extremities of the transepts or of aisles, etc. See cuts under *basilica* and *tema*. Also *apsos*.

In such use it does not express probability or tendency, but merely the possibility of exposure or risk. *Subject* expresses what is likely to happen to a person or thing, and occasionally does happen. *Liable* to disease and *subject* to disease thus convey different ideas. The things to which we are *liable* are determined more by accident or circumstance, the things to which we are *subject* are determined by nature and constitution. *Apt* to be suddenly ill, *liable* to be not *likely*, to die before the physician arrives, *subject* to attacks of epilepsy

More particularly applied to structures of masonry and tunnelling for the conducting of water from distant sources to large cities through tubular conduits. Aqueducts were extensively used in the Roman empire, and many of these ancient structures still remain. They were constructed of stone or wood, sometimes tunneled through hills and carried over valleys and rivers on arches much of the labor upon them being uselessly expended from a mistaken idea of the necessity of a perfectly level course. The aqueduct of Segovia, originally built by the Romans, has 160 arches. It is in some parts built in two tiers 100 feet or more in height, and is an admirable monument of ancient engineering. One of the most remarkable aqueducts of modern times is that of Marseilles, to which city it conveys the waters of the river Durance from a distance of about 55 miles, of which 10 miles consists of tunnels, and a considerable portion is traversed by means of viaducts of great height and length. This aqueduct was built between 1839 and 1847, and supplies water in such abundance that the environs of Marseilles, formerly

of birds established by Brisson in 1760, but having no characters by which it can be exactly defined. The name has been loosely applied to eagles and other large diurnal raptorial birds which have no tooth of the beak. It is now restricted and somewhat definitely applied to eagles having hooked beak, that is, having the shank more or less completely feathered. Such are the golden eagle, *A. chrysaetos* of Europe and North America, the spotted eagle *A. nebulosa*, of Asia and Europe, the imperial eagle, *A. heliaca*, of the same region, the Russian eagle, *A. clangens*, etc. See cut under eagle.

The flowers have five flat elliptical, colored sepals, alternating with as many spurred petals, the fruit consists of five follicles with numerous seeds. The spurred petals with incurved lobes have been compared to five pigeons, the sepals representing the wings, and to this the English name *columbine* refers (from Latin *columba*, a pigeon). Several species are common in cultivation, and, as they are prone to sport and hybridize, the varieties of form and color are numerous. There are 10 North American species in some of which, from the Rocky Mountains and Mexico, the spurs are several inches in length.

It afterward became the Frankish and French duchy (and for some time kingdom) of Aquitaine (held as an appanage of the English crown through intermarriage for about 300 years before 1453) and finally, greatly reduced, the French province of Guienne (a medieval corruption of *Aquitania*).

It has two working chambers into which steam is alternately admitted. By the condensation of the steam a partial vacuum is formed to fill which water rushes in. When the chamber is full of water a valve opens, and steam enters and forces the water out into a pressure or delivery chamber. The steam condenses as before, causing the inflow of a further supply of water. One chamber is filling while its companion is discharging, thus keeping up a continuous delivery. II. n 1 A kind of ornament of a capricious and fanciful character, consisting of lines, geometrical figures, fruits, flowers, foliage, etc., variously combined and grouped, and painted, inlaid, or wrought in low relief used especially for the decoration of walls and ceilings, but also for the decoration of objects of any nature. In the arabesque of the Mohammedans animal forms were rigidly excluded, in accordance with the requirements of their religious law, but the Greeks and Romans, and the Renaissance artists, among them Raphael and his scholars, to whom are due the rich arabesque decorations of the loggia of the Vatican, had all the kingdoms of nature under contribution. The Greeks undoubtedly derived the idea of pictorial or plastic ornament of this kind from the Oriental stuffs, painted, woven, or embroidered with natural or fabulous forms of plants and animals, which were brought to them by Phoenician traders from a very early period.

II. n 1 A native of Arabia, an Arab. 2 One of a Christian sect of the third century (commonly called *fratriti*) which sprang up in Persia, beyond the Jordan, a region often included in Arabia. According to Eusebius, its members asserted that the human soul, as long as the present state of the world exists, is joined with the body, but that it would be released again with the body at the time of the resurrection. The point was discussed with them by Origen, at a council with so much force that they were led to change their opinions.

styles of architecture, but applied especially to Egyptian and Oriental examples. This architecture shows in its systems of construction and ornament the profound influence of Persian and Byzantine models, though, as a rule, in architectural science it falls far behind the work of the Byzantine masters. The ovoid conical dome supported on pendentives is a characteristic feature, the buildings are usually square or polygonal in plan, seldom circular, the roofs are in general flat, and supported by arches resting on columns forming long parallel aisles, and often surrounding a central court. The arches are very commonly of the horseshoe shape developed in Persia, and from the beginning show the pointed form, though it is clear that neither form was adopted for constructive reasons, and that neither influenced the methods of building, much less revolutionized the entire art of architecture, as did the adoption of the pointed arch in western Europe. Walls, particularly interior walls, ceilings, domes, apse, etc., are commonly covered with an intricate lacework of arabesques, usually executed in relief on stucco, and often colored with at once great brilliancy and great delicacy. The most noteworthy examples of the style exist in Cairo—**Arabic figures or characters**, the numeral characters 1, 2, 3, 4, 5, 6, 7, 8, 9, 0, so called as having been introduced into European from Arabic. They were so introduced in the twelfth century, and the work of Leonardo da Vinci, published in 1502, contributed much to their dissemination. They were taken from the Arabic work of Al Khwarizmi (see *algorism*), who obtained them in India or Afghanistan. The system in its complete form (with the cipher) certainly originated in India, but what the ultimate origin of the characters was, whether they had been previously known in Europe without the cipher, and their history among the Arabians, are matters still in dispute.

II. n The language of the Arabians, a Semitic dialect, belonging (along with the Hymaritic and Abyssinian languages) to the southern branch of the Semitic family, and generally regarded as exhibiting more ancient features than any other Semitic tongue. It is the language of the Koran, the sacred language of Islam, and possesses an immense literature, almost wholly Moslem and later than the time of Mohammed. Many other languages have borrowed largely of its material, from the Persian, Turkish, Hindu, Malay, and Malay on the east to the Spanish on the west.

The animals breed in the hollows of decayed trees, which they enlarge by means of their beak. The prevailing color of their plumage is green, often varied with spots or bands of black, or of brilliant red and yellow. They are natives of the warm parts of South America. 2 In ornithology, the specific name of one of the aracaris, *Pteroglossus aracari*. The species are herbaceous perennials, mostly aculeate, from tuberos or creeping roots, but in the tropics often tall, rooting climbers. The inflorescences, usually monocious or dioecious, are crowded upon a spadix surrounded by a spathe, with which it is sometimes confluent. The order includes 98 genera and about 1,000 species, abundant within the tropics, but comparatively rare in temperate regions. The larger genera are *Anthurium*, *Philodendron*, *Arisæma*, and *Pothos*. In temperate North America there are 10 species, belonging to 8 genera, of which the most common is the Jack-in-the-pulpit, or Indian turnip, *Arisæma triphyllum*. The skunk cabbage, *Symplocarpus foetidus*, and the snowflake, *Acorus calamus*, are also well known representatives of the order. The tuberous roots of many species abound in starch and furnish a wholesome food when cooked, or after the acidity has been removed by washing, as in the taro, *Colocasia antiquorum*, which is extensively cultivated in tropical countries. British or Portland arrowroot is manufactured from the roots of *Arum maculatum* (the wake robin or cuckoo pint), the species of which are natives chiefly of tropical countries. A principle of acidity generally pervades the *Araceae*, existing in so strong a degree in some as to render them dangerous poisons as *Dioscorea*, *Scilla*, *Veratrum*, and *Colocasia*, which receives its popular name *dumb cane* from the fact that when it is chewed the tongue becomes swelled by the acrid juice, and the power of speech is destroyed. Many species are cultivated in greenhouses, chiefly as foliage plants, and

The genus is remarkable in the order for its elongated pedicel like calyx tube, and for the manner in which the growing stipe of the ovary bends downward and, attaining a length of 2 or 3 inches, pushes the ovary into the ground, where it begins to enlarge and ripen. The best known species is *A. hypogaea*, the common peanut or groundnut, which is now cultivated in most warm climates, and is esteemed a valuable article of food. Its pod when mature is oblong, often contracted in the middle, wrinkled, of a pale yellow color, and contains two seeds of the size of a hazel nut, sweet in flavor, especially when

Numerous minute glands, provided with separate ducts, secrete the viscid material which hardens into silk when exposed to the air. The glands have been divided into five kinds: aciniform ampullate, aciculate, tubiform and tuberosus. Their ducts enter the arachnidial mamillae and discharge through orifices in the arachnidial papilla.

II. n. 1. A kind of fossil madreporic — *2* In anat., the serous membrane enveloping the brain and spinal cord, the middle one of the three cerebrospinal meninges, between the dura mater and the pia mater. It was formerly regarded as consisting of two layers: a visceral layer investing the pia mater and a reflected parietal layer lining the dura mater, the two constituting a shut sac, like other serous membranes, enclosing a cavity called the arachnoid cavity, containing a serous fluid, the arachnoid fluid, but the more modern view regards the arachnoid membrane as a single sheet external to the pia mater and attached to it but not following it into the sulci and other depressions of the brain. What was formerly called the cavity of the arachnoid is now termed the subdural space. The arachnoid is by some regarded as simply the outermost layer of the pia mater. A crossbow used in the middle ages. The bow was made of steel, horn, or other material, and was of such great strength and stiffness that some mechanical appliance was used to bend it and adjust the string to the notch. The lighter *arbalists*, used in the chase, and generally by horsemen, required a double hook which the *arbalist* carried at his side. Heavier ones required a kind of lever, or a wheel, or a revolving wheel with a ratchet and long handle, to draw them; these appliances were separate from the *arbalist*, and were carried slung from the shoulder or at the belt. The short and heavy arrow of the *arbalist* was called a *quart*, from its square head, or more commonly a *bol*, as distinguished from the *shaft* discharged by the longbow. Sometimes *stones* (see *stone bow*) and leaden balls were used. The use of the *arbalist* was discredited with such force as to penetrate ordinary armor, and the weapon was considered so deadly as to be prohibited by a council of the church except in warfare against infidels. It could, however, be discharged only twice a minute. It was used especially in the attack and defense of fortified places. For similar weapons of other periods than the European middle ages, see *crossbow*. Also *arbalist*, and formerly *arblast*.

2. In *her.*, a crossbow used as a bearing.

Two of these viz., *arbitrage* or arbitration in bullion and coins, and *arbitrage* in bills also called the arbitration of exchanges, fall within the business of bullion dealing and banking respectively. arbitration (ar-bi-trā'shon), *n* [*< ME arbitracio, < L arbitratio (n-), < arbitrar, arbitrate, judge, see arbitrate*] The hearing and determining of a cause by two or parties in controversy by a person or persons chosen or agreed to by the parties. This may be done by one person, but it is usual to choose more than one. Frequently two are nominated, one by each party the two being authorized in turn to agree upon a third who is called the umpire (or, in Scotland sometimes the *arbitrator*) and who either acts with them or is called on to decide in case the primary arbitrators differ. The determination of arbitrators or umpires is called an *award*. By the common law an award properly made is binding but the arbitrators' authority may be revoked before award at the will of either party. Permanent boards of arbitration are sometimes constituted by legislative or corporate authority but the submission of cases to their decision is always voluntary

Archæopteryx (ar-kē-ōp-ter-yūks), *n* [NL, < Gr *αρχαῖος*, ancient, + *πτερόν*, a wing, a bird, < *πτερόν*, a wing, = E. feather] A genus of fossil reptilian Mesozoic birds discovered by Andreas Wagner, in 1861, in the lithographic slates of Solenhofen in Bavaria. It is of Jurassic age, and is notable as the oldest known avian type, and

as combining some characters of a lizard with those of a bird. The original fossil consisted only of the impression of a single feather, upon which the name *Archæopteryx*

Archæopteryx. (From slab in British Museum.)

lithographica was imposed by Von Meyer. A second specimen from the same formation and locality was named *A. maerula* by Owen. The specific identity of the two can be neither affirmed nor denied, and their generic identity is only presumptive. A third and still more characteristic specimen is identical with the second and has furnished many additional characters. Members of this genus had to the long lizard-like tail formed of many vertebrae and separate metacarpal bones in combination with a calcaneosternum and other features of modern birds. It is thus a unique type of ornithic structure and represents a distinct subclass of *Archæo-Sauria*.

archæostomatous (ar-kē-ōs'tō-ma-tus), *a* [< NL *archæostomatus*, < (Gr *αρχαῖος*, ancient, + *στόμα* (-), mouth)] 1. Pertaining to or having the characters of the *Archæostomata*. — 2. In *biol.*, having a primitive blastopore or original orifice of invagination of a blastosphere which has undergone gastrulation, retaining an archenteric aperture, as distinguished from any other which may be acquired by a deuterostomatous gastrula. It is the usual state of those gastrulae which are formed by emboly.

In the former [process of gastrulation by emboly] the blastopore would be left as the aperture of communication of the endoderm with the exterior, and the result would be the formation of an *archæostomatous gastrula*. Huxley, Anat. Invert., p. 685.

archæus (ar-kē'us), *n*, pl *archæi* (-i) [NL, < Gr *αρχαῖος*, ancient, primitive, < *αρχή*, beginning, < *ἀρχή*, be first see *archæo-*] In the philosophy of Paracelsus and other spagyrics, mystics, and theosophists, a spirit, or invisible man or animal of ethereal substance, the counterpart of the visible body, within which it resides and to which it imparts life, strength, and the power of assimilating food. The word is said to have been used by Basil Valentine, a German chemist of the fifteenth century, to denote the solar heat as the source of the life of plants. Paracelsus uses it with the above meaning. It is frequent in the writings of Van Helmont, who explains it as a material preexistence of the human or animal form *in posse*. He regards the archæus as a fluid that is as a semi-material substance like air, and seems to consider it a chemical constituent of the blood. Paracelsus had particularly made use of the hypothesis of the archæus to explain the assimilation of food. This function of the archæus became prominent in medicine. Van Helmont calls it the door-keeper of the stomach (*janitor stomachi*). There are further diversifications of meaning. Also spelled *archeus*.

There is in the best archaic coin work [of the Greeks] a strength and a delicacy which are often wanting in the fully developed art of a later age. Head, Hist. Numism., Int., ix.

The archaic, in art, not simply the quality of rudeness or of being primitive, but a richness and imperfection implying the promise of future advance. Work that is merely barbarous is not properly archaic. The archaic style in art of sufficient force to have any development, succeeds the first rude attempts of a people to make a graphic representation, and exhibits a manifest sincerity and striving to attain truth until finally the archaic quality disappears little by little as truth is reached in the great art schools such as those of Greece and of the Renaissance painters or as art sinks into lifeless conventionalism before reaching truth, as in the sculpture of Egypt and Mesopotamia.

The word occurs in two passages of the Bible, 1 Thes. iv 10, and Jude 9. Michael, mentioned in the latter as an archangel, also in Daniel as the spiritual prince of the Jews, and in Rev. xii 7 as the leader of the heavenly hosts against the dragon and his angels, is the 4th Michael of the church calendar. Coming after him in dignity, three other names are especially known by name as archangels: Gabriel, the heavenly interpreter and announcer on behalf of Dan. viii 16, ix 21, Luke i 19; Raphael, the guardian angel commissioned in the book of Tobit, and Uriel (2 Iud. iv 17), the five or light of God, often mentioned, like the others in Milton's "Paradise Lost." Three other names are added by tradition to make the number seven (Tobit xii 15, Rev. viii 2, where the angels mentioned are taken as archangels): Chamael, Jophiel or Zophiel, and Zadkiel, and still others are spoken of.

For archangels were the first and most glorious of the whole creation: they were the morning work of God, and had the first impressions of his image.

It was also occasionally applied in the East to exarchs and metropolitans of sees of exceptional antiquity or dignity, and was sometimes extended in later times to others of the same rank as a special distinction. In the West, from the eighth or ninth century, the title was given to metropolitans of every class, and this is still the use of the Roman Catholic Church. Archbishops have certain rights of honor and jurisdiction over their suffragan bishops (that is, the bishops of the dioceses making up their ecclesiastical province), such as those of calling and presiding over provincial councils, receiving appeals in certain cases, etc. But these rights, formerly very considerable, are now comparatively limited. At present the archbishop is not always a metropolitan, since there have long been a few archbishops without suffragans, and often still the title is purely honorary. See *primate*. The insignia of an archbishop in the Roman Catholic Church are the wooden pallium, before receiving which from the pope he cannot exercise the functions of his office, and the double cross borne processsionally before him. In the Anglican Church there are four archbishops, two in the Church of England (those of Canterbury and York, the former of whom is metropolitan of all England), and two in the Church of Ireland (those of Armagh and Dublin, the former of whom is primate). The word is found as the title of an ecclesiastical dignitary from the fourth century. In the East it is last found as applied to an ecclesiastical officer of the court of Constantinople under the late Byzantine empire. In the West, from the eighth century, dioceses began to be divided into separate territories, over which rural archdeacons were placed, having under them deans or rural archpriests, charged with the supervision of the parish priests of their respective districts, over these was the general or grand archdeacon of the whole diocese, who took precedence of the archpriest (which see), and held his own court with his officials, distinct from that of the bishop so that appeals were taken from the former to the latter. The rural archdeacons were often priests, having a cure of souls, as was also the grand archdeacon from the twelfth century. The powers and privileges of this office were gradually restricted and in the Roman Catholic Church, since the Council of Trent, its place is for the most part supplied by the bishop's vicar general, between whom and the parish priests are some times found the vicars forane, or present rural deans, while the archdeacon of the present day, where the office survives, holds a dignity of honor. In the Church of England each bishop has the assistance of two or more archdeacons who as his deputies inspect and manage the affairs of the diocese, and perform a variety of duties partly secular and partly ecclesiastical. In two dioceses of the Protestant Episcopal Church of America the title *archdeacon* has been introduced — *Archdeacon's court*. See *court*

ture includes, in the widest sense, (1) the principles of design and of ornament as applied to building, (2) the science of construction, including the properties of materials and the methods of combining them, and (3) the practice of construction including estimates of cost and the directing of builders and workmen. The practice of this art requires skill in design which is the special province of the architect, and skill in execution, which is the special province of the workmen whom the architect employs and directs. It is the function of skill in architectural design to combine in a harmonious scheme those independent and often hostile requirements (1) of use

Cartilaginous skeleton of limb (artropod) of *Ceraurus forsteri* the large upper piece articulating with the limb root

and convenience as dictated by the conditions of the problem in hand, (2) of constructive necessity and fitness as determined either by practical experience or by scientific theory, and (3) of artistic excellence both in the proportions of the parts and in the decorative treatment of details, in accordance with either the general principles and canons of good taste or the prescriptions of custom or tradition. It is the function of skill in execution practically to carry out the scheme so designed, and this skill is exercised by draftsmen, surveyors, mechanics, artisans, and artists, each in his place. Architecture is properly distinguished from mere building by the presence of the decorative or artistic element. The most important styles in the history of architecture are the Egyptian, Assyrian, Hellenic, Roman, Byzantine, Medieval (including Romanesque and Gothic), Renaissance, and Arabic (See these and other adjectives characterizing architectural styles). The various later medieval styles are commonly included under the vague and misleading term Gothic (which see).

Architecture, the art of building, includes two elements, theory and practice. The former comprehends the fine artistic power, the body of general rules inspired by taste and based on tradition and the science which admits of demonstration by means of invariable and absolute formulas. Practice is the application of theory to particular needs, it is practice which causes the art and the science to conform to the nature of materials, to climate, to the customs of a period, or to the necessities of the occasion.

Vollet le Duc, Dict. de l'Architecture (trans.), I, 116.

We must consider *Architecture* as the great law which has in all times regulated the growth and affected the form of painting and sculpture, till they attain to a certain point in their development, and free themselves from its influence. (*P. Vollet, Art and Architect.* p. 29)

1 A chief magistrate of some states in ancient Greece, and particularly Athens. After the abolition of the title of king in Attica there was chosen a single archon who exercised for life essentially royal prerogatives. The term of office was afterward reduced to ten years, and in 683 B. C. it was made annual, and the duties of the archonship were distributed among nine persons. The first was the *archon eponymos* (name giving archon), whose functions were executive and judicial, and whose name was given in official acts, etc., to the year of his service. The second was the *archon basileus* (archon king), whose duties were chiefly religious and ceremonial. The third was the *archon polemarchus* (archon generalissimo), who was, first in fact and then nominally, commander of the military power, and the remaining six were the *thesmophetes*, or administrators of justice, whose most important duty it was to pass carefully in review, each year, the whole body of laws of the state, in order to make sure that no errors or contradictions had crept in, that repealed laws had been duly cancelled, and that repetition was avoided. It rested with the thesmophetes, also, to see that all the laws of the republic that were in vigor were strictly enforced, and to bring to trial any public official who had failed in his trust. At the end of his year of office, all the archons, unless they were found guilty of malfeasance, by virtue of their office entered the council of the Areopagus.

For relations with other officials, see *archdeacon*. At present, in the Roman Catholic Church, *archpriest* is, for the most part, a title of honor only, the former duties of the office being performed by the auxiliary bishop or the dean of the cathedral chapter. The duties of the rural archpriests, since the Council of Trent, have commonly devolved on the vicars forane, still sometimes called rural deans, or directly on the bishop's vicar general. = *Syn* *Argue*, *Dispute*, *Debate*, *Discuss* plead expostulate, reconstitute. To *argue* is to defend one's opinion or to exhibit reasons or proofs in favor of some assertion or principle. It implies a process of detailed proof by one or more persons. To *dispute* may be to call in question the statements or arguments of an opposing party as, to

dispute about an award. It often means the alternate giving of reasons, especially by two persons. It is often applied to mere bickering, and is in general less dignified than the other words. To *debate* is to interchange arguments in a somewhat formal manner, as in debating societies and legislative bodies. To *discuss* is, by derivation, to shake or knock a subject to pieces in order to find the truth, or the best thing to be done. A *debate*, therefore, may be viewed as a *discussion* or a *discussion* as a *debate*. Strictly, a *discussion* is an amicable presentation of opinions, not limited, like the other, to affirmative and negative sides of a proposition, and with the expectation on the part of all that the conclusion will be the adoption of no one person's opinion or plan unmodified. To *argue* a point, to *dispute* a position, to *dispute* with a neighbor, to *debate* a motion, to *discuss* a subject or a plan.

[The familiar meaning of the word probably originated by Roman law courts. The usual definition given by Cicero and almost all authorities is *ratio reddenda facinus potest*, a reason causing belief of a doubtful matter. Doe thus in one place defines it as a medium proving a conclusion. The word *medium* here means a premise or premises, according to all the commentators (*Petrus* *Thap*, tr 5 ad int.) But since *medium* usually means the middle term of a syllogism some logicians have been led to give *argument* this signification.]

2 The middle term of a syllogism [See preceding note]

Argument is the bare proof or mean term which is invented by him that disputeth, to prove the truth of the question. In argumentation is the whole reasoning itself, of what form soever it be, comprehending both the question and also the proof thereof.

Tables of double entry have two arguments. In the Ptolemaic astronomy, the *argument*, without qualification, is the angular distance on the epicycle of a planet from the true apogee of the epicycle, and the *equation* of the *argument* is the angular distance, as seen from the earth, of a planet from the center of the epicycle, the correction to the second inequality. II *n*. In *theol.*, one who adheres to the doctrine of Arius and his school. Arius was a presbyter of the church of Alexandria in the fourth century. He held that the Son was begotten of the Father, and therefore not coeternal nor consubstantial with the Father, but created by and subordinate to the Father, though possessing a similar nature. The name Arius is given in theology not only to all those who adopt this particular view of the nature of Christ, but also to all those who holding to the divine nature of Christ, yet maintain his dependence upon and subordination to the Father in the Godhead. As a class the Arians accept the Scriptures as a divinely inspired and authoritative book, and declare their doctrine to be sustained by its teachings. The doctrine of Arius was authoritatively condemned by the Council of Nice A. D. 325, which decreed that Jesus Christ was "very God of very God, begotten, not made, of one substance with the Father."

child-birth, *< aristos*, best, + *lochia*, child-birth see *lochia*] A large genus of apetalous exogenous plants, the type and principal genus of the natural order *Aristolochiaceae*, chiefly woody climbers, and very widely distributed. There are about 180 species, of which 7 are found in the United States. They are remarkable for their curious flowers, which vary greatly in form and size, but are all so constructed as to imprison in some way the insects which visit them. The flowers are usually of a dingy hue.

Aristotelianus*, < Gr *Ἀριστοτέλης*, Aristoteli, Aristoteli] *I*, a Pertaining to Aristotle (born at Stagira in Macedonia, 384 B.C., died 322 B.C.), the father of logic and the most influential of all philosophers, or to his works, school, or philosophy. See *peripatetic*.

Aristotelian logic (a) The logic of Aristotle, especially in the modified form taught in the middle ages. (b) Formal logic, based on the four propositional forms. All S is P. No S is P. Some S is P. Some S is not P. *Aristotelian series*, a progressive chain of reasoning like the following: He who is prudent is temperate, he who is temperate is constant, he who is constant is unperturbed, he who is unperturbed is without sorrow, he who is without sorrow is happy, therefore the prudent man is happy.

The progressive *series* has been called the common to *Aristotelian*. This latter denomination is an error. Aristotle, though certainly not ignorant of the process of reasoning now called *series*, does not enter upon its consideration. See *W. Hamilton*.

II, *n* A follower of Aristotle. See *peripatetic*.

Aristotelianism (ar-is-to-tō-lē-an-izm), *n* [*L. Aristotelianus* + *-ism*] The philosophy of Aristotle, or any later modification of it. Aristotelianism is a kind of metaphysical evolutionism. Its central idea is the distinction of *act* and *potency* (actuality and potentiality). The nature of the world as a whole as well as every part of it, may be illustrated by the analogy of the growth of a tree from a seed. The tree has a sort of being in the seed — a potential being — it exists in *potency* only. That which is actualized in the perfected development from the seed, the tree, exists in *act* or actuality. This perfected development, the entelechy, is the characteristic nature of the thing, which places it in some natural species and which is its *form*, or that element of the thing, which makes it to be the kind of thing that it is. The other element which merely makes the thing to be is its *matter*, which as unformed is identified by Aristotle with the *potency* or potentiality of a germ. Every event is an act of development. Most events take place under the influence of an external efficient cause, and their character is determined by an end. *Matter*, *form*, *efficient cause*, and *end* are the four Aristotelian causes of principles. But not all events are brought about by external efficient causes. Some happen by fortuitous spontaneity and are not determined by any causes what ever. Other events come to pass naturally that is by a self-determined growth. Besides that which is moved but does not cause motion and that which is both moved and causes motion, there must needs be a *tertium quid*, which is not moved, yet causes motion, and this is God or *pure act* (actuality) without undeveloped potentiality. The soul is the entelechy or perfect flower of the body. It has three parts, the vegetative (or merely vital) the sensible, and the rational. The reason is not a mere belonging of the individual. It exists before the body and, as the active reason, is common to all persons upon the tablets of whose passive reason it writes its dicta. Space and time are mere logical elements of motion. Aristotle is justly called the father of logic, although there were some vague

logical doctrines before him and although his system is now largely superseded. He holds the only excellent reasoning to be syllogism, and all other kinds of reasoning to be imperfect approximations to syllogism. Particular facts are first and best known to us, but general truths are first and best known in themselves. Science must set out with certain fixed first principles, which are definitions. Knowledge is a development from impressions of sense, to the formation of which reason and experience both contribute. Things are of ten classes, substances, relations, quantities, qualities, etc. See *categories*. Different genera are subdivided upon different principles, so that there are no cross divisions in the real classification of nature. It is possible to so collate passages from Aristotle as to make him appear as an inductive logician, but the whole cast of his mind was such as to lead him to underrate the importance of induction. He lays much stress on the principle of excluded middle, which he treats as a corollary of the principle of contradiction, and he has a general leaning to find and rather wood a distinction. The most important of his ethical doctrines are that happiness lies in the working out of one's inward natures, and that every virtue is a golden mean between two vices.

The herakle bearings of an individual or a community, consisting of some device in heraldic tinctures (see *tincture*) borne on a shield, generally with the addition of a crest and sometimes with supporters. A description in heraldic terms of shield, crest, etc., is called *blazoning* (which see). The right to bear the arms of the father is inherited by the sons, but in strictness each of the younger sons should add to the paternal shield a label as a mark of cadency, the same right descends to a daughter only if she is her father's heiress. A person inheriting an estate other than the paternal one often assumes the arms of the former possessor, but should in strictness apply to the proper authorities. See *king at arms*, *herald* and *heralds*, *coll n*. Arms not paternal may be chosen as follows: (a) Arms of dominion, or the national arms borne by the sovereign in which generally the bearings inherited by the prince as an individual have come to have a certain national character. (b) Arms of community, as of a corporation or a diocese, or of the like. Arms assumed by a republic as by the United States or by one of the States, partake of the nature of both the preceding. (c) Arms of pretension, as specifically, those assumed by a sovereign in assertion of his claim to a realm not actually under his authority, like the fleurs de lys of France, which were borne by English sovereigns until 1801. (d) Arms of succession, denoting inheritance of an estate as mentioned above. (e) Arms of assumption, or assumptive arms, bearings assumed or granted in consequence of an exploit, as the three feathers with the motto *Ich dien* taken from the sham king John of Bohemia by Edward the Black Prince at the battle of Crécy (1346), and now borne by the Prince of Wales. (f) Arms of alliance, as where one spouse impales the arms of the other on his or her shield. (g) Arms of office, arms which are the prerogative of appendage of some public position. In all the above cases except (a) and (b) a private individual having a right to such arms changes them with the paternal arms, whether by quatering or otherwise. In this way the name De Loupe may have been given to the first earls of Chester because of their bearing a wolf's head, or the name Arundel may be derived from swallows (French *hirondelles*) borne on the shield. The arms of Bolton are a crossbow bolt driven through a tin castle and I can find for their chief bearings a castle and a lion respectively. There are many such cases. It has therefore been credited

with holding Monophysite or Eutychian doctrine, but many authorities hold that the differences arose from misunderstandings occasioned by the incapacity of the Armenian language to express the finer distinctions of Greek terminology. The Armenian Church accepts all the first seven ecumenical councils, with the exception of that of Chalcedon, the doctrines of which they seem, however, to hold under a different phraseology. Their doctrines and usages closely resemble those of the Greek Church, with the exception of their use of unleavened bread and of an unmixed chalice in the eucharist. The priesthood is hereditary. The bishops are governed by four patriarchs the primate being the catholicos, who resides in the monastery of Etchmiadzin, a short distance north of Mount Ararat. Since the fifteenth century a large number of the Armenians have joined the Roman Catholic Church and are known as *United Armenians*. A separate Armenian Protestant Church has also recently been formed — **Armenian era, liturgy**, etc. See the nouns — **Armenian stone**, a soft blue carbonate of copper also, a commercial name for lapis lazuli.

Its members were also called *Remonstrants*, from a statement of their views in the form of a remonstrance presented to the States General in 1610. They separated from the Calvinists, objecting to their doctrine of predestination. The sect as a distinct organization is chiefly confined to the Netherlands where its numbers are only about twenty congregations and a few thousand adherents

2 A believer in the Arminian doctrines. These doctrines are (1) conditional election and reprobation, in opposition to absolute predestination as taught by

Calvin (2) Universal redemption, or that the atonement was made by Christ for all mankind, though none but the elect can be partakers of its benefits. (3) That man, in order to exercise true faith, must be regenerated and renewed by the operation of the Holy Spirit, which is the gift of God. (4) That this man is not irresistible. (5) That believers are aided by the aid of the Holy Spirit to resist sin but that there is always in this life the possibility of a fall from grace. In opposition to the Calvinistic doctrine of the perseverance of the saints. Protestants in general shared in the controversy excited by the promulgation of these doctrines and all opponents of Calvinism are still often characterized as Arminians. In the Church of England Arminianism was especially favored by the High Church party. The Methodist denomination was divided on the subject, the followers of Wesley being Arminians, and those of Whitfield Calvinists.

In criminal or penal cases *arrest* is made for the purpose of compelling the person charged with a crime or an offense to appear and submit to justice. In civil cases it cannot be legally effected except by virtue of a precept or writ issued out of some court, but this is often dispensed with in criminal cases. *Arrest* in civil cases is of two kinds, viz., that which takes place before trial, and is called *arrest on *main* process*, and that which takes place after trial and judgment, and is called *arrest on *final process* or *arrest on execution**

=**Syn** *Pride, Arrogance, Presumption, Assumption, Haughtiness, Dudaism, Loftiness, Superbity, Inso-*
lence, lordliness, self importance, imperiousness, swagger
(See *pride*) *Pride* and *dudaism* are the only words in
the list that may have a good meaning when applied to per-

sons: *as, pride in one's country, disdain of a base suggestion. Pride primarily respects the temper of the mind, not being necessarily manifested or directed toward others, it is the general term for an unreasonable estimate of one's own superiority in any respect. As it comes into relation and action, it may receive other titles. Thus, arrogance is, at its simplest, *pride with contempt of others*, and is essentially the same as *disdain*. In action, *arrogance* is the assertion of exorbitant claims to rank, dignity, estimation, homage, power, etc. *Presumption* is often used for *arrogance*, but more properly expresses a self-conceited and self-important forwardness to run risks, take liberties, and crowd in where one does not deserve to be. *Presumption* helps itself to what it wants, while *arrogance* claims from others, and feeds its *pride* by seeing them yield. *Presumption* is less selfish than *arrogance*, but more conceited and headstrong. *Assumption* has added to its other meanings a bad sense, kindred to *presumption*, it means a disposition to do what does not belong to one to do, and sometimes to claim to be more than one is. *Haughtiness*, like *disdain* and *loftiness*, dwells upon the inferiority of others quite as much as upon its own elevation, it is equally applicable to spirit and to manner. *Disdain* is a mingling of lofty contempt with aversion, abhorrence, or indignation. *Superciliousness*, as befits its derivation, is chiefly applied to manner, it is a manifested haughtiness. *Insolence* is exhibited not only in manner, but in conduct and language, it is *pride or haughtiness*, shown in contemptuous or overbearing treatment of others, especially by words, from an equal or an inferior it is an outrageous kind of impertinence. See *impudence*, *egotism*, and *scorn*.*

Your pride to yield no meek to mine,

be shot from a bow. Arrows have nearly universally been made with a light, straight shaft of wood, fitted

with feathers at the nock-end to steady the flight, and with a pointed head of various forms often barbed so as to remain fixed in the object pierced

Those used in the middle ages rarely had barbed heads, sometimes the head was flat, sometimes conical, and fitted to the shaft like the ferrule of a walking stick. The arrow heads of the North American Indians were of flint, obsidian or other hard stone, or of bone as well as of metal, and were often barbed. They were secured to the shaft by lashings of hide or sinew. Arrow heads intended to be poisoned, as among South American Indians are said to be fastened lightly, so as to leave the shaft and remain in the wound. The feathers at the butt of the shaft seem to have been generally used in all ages and are so set, or are of such a form, as to give to the arrow a rotary movement, like that of a rifle ball. The object of science is knowledge, the objects of art are works. In art, truth is the means to an end, in science it is only the end. Hence the practical arts are not to be classed among the sciences. Whewell

6 A branch of learning regarded as an instrument of thought, or as something the knowledge of which is to be acquired in order to be applied or practised chiefly in the plural, and in such phrases as master of arts, faculty of arts, etc. Formerly in the universities the seven liberal arts were the Roman trivium, grammar, logic, and rhetoric, and the Pythagorean quadrivium, arithmetic, music, geometry, and astronomy. But by art, in the middle ages, was usually meant logic, that being the principal study in the faculty of arts.

Bachelor of Arts See *bachelor* — **Black art**, in many senses, the fancied power of performing wonderful feats by pretended means, especially means derived from the assistance of the powers of evil, opposed to *white art* or *white magic*, that is innocent magic. [Black art is a kind of translation of Middle Latin *magomantia* magic a corruption due to confusion with Latin *magus* black (see *magus*), of *magomantia* from the Greek *magos* (see *magus*)] The confusion was assisted by the common practice of painting the devil black — **Decorative art**, that branch of art which has for its primary object merely the pleasure of the eye, especially in decoration which is subservient to architectural features or to form, as in ceramics — **Faculty of arts**, the lowest and fundamental faculty of the four in the old universities, the faculty of philosophy which had charge of students upon their first entrance and until they took the degree of master of arts. When a boy could read, write and had mastered the elements of Latin grammar he was considered ready to begin his studies in logic at the university. The instruction in the faculty of arts was sharply separated from the texts preliminary to the conferring of degrees. In the middle ages the subjects of the ordinary lectures were Priscian's grammar, the language of sophistry Aristotle's Organon and the 16 Division and three books of the Topics of Boetius while the extraordinary lectures related to rhetoric, ethics and a little geometry and astronomy. Frequent disputations constituted the only exercises for the scholars and the master's disputation in public once a week. The degree conferred at the recommendation of the faculty of arts were those of bachelor and master. In Paris the degree of licentiate was a distinct one intermediate between the others. The licentiate or determination was not originally a degree. Upon the reform of the universities in the sixteenth century logic gave place to the humanities, and during the present century natural science has had a more considerable place in the instruction — **Fine arts**, those arts which seek expression through beautiful modes, especially architecture, sculpture, painting and engraving — **Hermetic art** See *hermetic* — **Master of Arts** See *master* — **Military art** See *military* — **Plastic art** or *arts*, sculpture including all subordinate or related arts by which objects are represented in the round or in relief — **Work of art**, anything in the formation or into the accomplishment of which art in any sense has entered especially a production of any one of the fine arts but especially of one of the imitative members of the group as a statue or a painting

= Syn. 2 Aptitude, readiness, address, tact, adroitness, contrivance. 3 Skillfulness, subtlety, cunning, artifice, deceit, duplicity. — 4. *Art*, See *see*. The essential difference between an *art* and a *science* is in aim. "Science and art may be said to be investigations of truth, but science inquires for the sake of knowledge, art for the sake of production (*Karlsruhe*). Hence they differ somewhat in that with which they are concerned. An art directly and immediately by itself concerns itself with a faculty. It focuses upon that and keeps it ever in its view as it teaches how that may be developed, trained and guided. A science, on the other hand, regards rather the product of a faculty, and, keeping its eye directly upon that, proceeds to unfold its nature and proper characteristics. (H N Day, Art of Discourse § 1) Incident to this difference is a difference in method, science being analytic and critical, while art is synthetic and constructive. In the matter which makes up the body of the two an art involves the means of discipline in the use of the knowledge which may have been furnished by a corresponding science. The same branch of knowledge may be regarded as either a science or an art. It may be viewed theoretically, as seeking, coordinating, arranging, and systematizing knowledge, and by observation, comparison, abstraction, and generalization deducing laws, or as, with more or less reference to such preparatory work, framing rules which are the lessons of experience and are designed to facilitate work or give it superior excellence. The more complete the scientific basis of an art the more perfect the art. There is a secondary use of the word science by which it stands for an art that rests upon a science as in the following

The fundamental conception of the occupation of the architect embraces the two ideas of science and art. Architecture as an art is the work of the skilled hand as a science, it is that of the informed and cultivated brain

2 One of a system of cylindrical, membranous, elastic, and muscular vessels or tubes, which convey the blood from the heart to all parts of the body by ramifications which as they proceed diminish in size and increase in number, and terminate in minute capillaries which unite the ends of the arteries with the beginnings of the veins. There are two principal arteries, the *aorta*, which rises from the left ventricle of the heart and ramifies through the whole body, and the *pulmonary artery* which conveys venous blood from the right ventricle to the lungs, to undergo arterIALIZATION. Most arteries are composed of three coats: an outer or fibrous, of condensed connective tissue well supplied with blood vessels and nerves; a middle or elastic consisting chiefly of circular, non striated muscular fibres, and an inner, thin, smooth, and dense, composed, from without inward, of an elastic sequestered membrane a layer of connective tissue and a lining of endothelium. The outer coat is the (*tunica*) *adventitia*, the middle, the (*tunica*) *media*, the inner, the (*tunica*) *intima*. The arteries in the human body which have received special names are about 350 in number. They range in caliber from more than the thickness of a finger to microscopic dimensions.

The was originally a demonstrative pronoun, and in meaning is in unambiguous this or that. It points out a particular individual or set of individuals, and is consequently known as the *definite article*. Articles may therefore be regarded as a specialized and segregated class of pronouns. Lords of the Articles. See *Lord* — **Marriage articles**. See *marriage* — **Memorandum articles**. See *memorandum* — **The Five Articles and the Five Points**, statements of the distinctive doctrines of the Arminians and Calvinists respectively, the former promulgated in 1610 in opposition to the restrictive principles of the latter, which were sustained by the Synod of Dort in 1619, and are the following: particular predestination, limited atonement, natural inability, irresistible grace, and the perseverance of saints. The discussion of these differences at that time is sometimes called the *great quarrel of the articles*. The *Lambeth Articles*, nine articles drawn up in 1595 at Lambeth England, intended to embody the Calvinistic doctrine respecting predestination, justification, etc. They were never approved by the church in any regular synod, and therefore possess no ecclesiastical authority — **The Six Articles**, sometimes called the "whip with six strings," articles imposed by a statute (often called the Bloody Statute) passed in 1539, in the reign of Henry VIII. They decreed the acknowledgment of transubstantiation, the sufficiency of communion in one kind, the obligation of vows of chastity, the propriety of private masses, celibacy of the clergy and auricular confession. Acceptance of these six doctrines was made obligatory on all persons under the severest penalties. The act, however, was relaxed in 1544, and repealed by the Parliament of 1549 — **The Thirty-nine Articles**, a statement of the particular points of doctrine, thirty nine in number, maintained by the Church of England first framed by an ecclesiastical commission in forty two articles (1562), and revised and promulgated in thirty nine articles by a convocation held in London in 1562-63. With some alterations they were adopted by the Church of Ireland in 1635, and by the Scottish Episcopal Church in 1804 and with certain modifications, by the Protestant Episcopal Church of the United States in 1801 — **The Twenty-five Articles**, the doctrinal basis of the Methodist Episcopal Church substantially the thirty nine Articles of the Church of England with the omission of the 1st, 8th, 13th, 15th, 17th, 18th, 20th, 21st, 24th, 29th, 33d, 34th, and 37th. They were originally framed by John Wesley, and, with some modification, were adopted, substantially as now held in 1784.

It is divided into five classes, *Crustacea*, *Arachnida*, *Insecta*, *Myriapoda*, and *Annelida*. This division corresponds to the *Annulosa* of some zoologists, but neither of these terms is now recognized by leading naturalists. human organs, and from the sounds made by the lower animals. The terms *articulate*, *articulation*, etc., as applied to human utterance, are not seldom misunderstood and wrongly used as if the "jointing" intended were that of the physical organs of utterance, a narrowing or closing of the organs at some point or points. Such action, however, belongs to all utterance, articulate or inarticulate, whether of man or of the other animals. See *consonant*, *syllable*, *vowel*.

=*Syn* *Artifice*, *Maneuver*, *Stratagem* Web *Trick*, *Ruse*, *Prison*, *device*, *contrivance*, *cunning*, *craft*, *deception*, *cheat*, *fraud*, *guile*, *imposition*, *dodge*, *subterfuge*, *double dealing*. These words generally imply a careful endeavor to compass an end by deceiving others, not necessarily, however, with evil intent. They all imply management and address. An *artifice* is prepared with art or care. It is craftily devised. *Maneuver* suggests something more elaborate or intricate, a carefully contrived movement or course of action for a definite purpose. It is the quiet or secret marshaling of one's intellectual or other resources to carry a point. *Stratagem* is like *maneuver*, a figurative term drawn from war, it is upon a larger scale what *ruse* is upon a smaller, a device to deceive one who is the object of an imagined warfare, so that we may catch him at a disadvantage and discomfit him, or more generally, a carefully prepared plan to carry one's point with another—to capture it or him so to speak. A *ruse* may be peculiarly cunning or insinuating. *Trick* is the lowest and most dishonorable of these words. It may be a low or underhand act in violation of honor or propriety for the purpose of cheating, or something as bad. A *ruse* is a deception of some elaborate nature intended to cover one's intentions, help one to escape from a predicament, etc., it is a plausible way of blinding about what we desire to happen, without apparent interference on our part. *Prison* is subtle in action. It is a more delicate sort of artifice. See *artful*, *cunning* and *craft*.

There are no traces of the word to be found outside of these two races. Its origin is obscure and disputed, there is no probability that it has anything to do with a root **ar*, plow.] I. a. II. n. 1. A member of the eastern or Asiatic division of the Indo-European family, occupying the territories between Mesopotamia and the Bay of Bengal, in the two subdivisions of Persia, or Iran, and India. [This is the older more scientific and still widely current use of the word. More recent but increasingly popular is the second use.]

2. An Indo-European or Indo-German or Ja-phetic, a member of that section of the human race which includes the Hindus and Iranians (Persians) as its eastern or Asiatic division, and the Greeks, Italians, Celts, Slavonians, and Germans or Teutons as its western or European division. The languages of all these branches or groups of people are akin—that is to say, they are descendants of one original tongue once spoken in a limited locality by a single community, but where or when it is impossible to say.

Many words still live in India and England that have witnessed the first separation of the northern and southern *Aryans*, and these are witnesses not to be shaken by any cross examination. The terms for God, for home, for father, mother, son, daughter, for dog and cow, for heat and tears, for axe and tree, identical in all the Indo-European idioms, are like the watchwords of soldiers. We challenge the seeming stranger, and whether he answers with the lips of a Greek, a German, or an Indian, we recognize him as one of ourselves. There was a time when the ancestors of the Celts the Germans the Slavonians the Greeks and Italians the Persians and Hindus were living together beneath the same roof, separate from the ancestors of the Semitic and Hamitic races.
Max Müller

as¹ (az), adv., conj., and pron. [*< ME as, ase, aly, also, also, also, alsa, al so, al sra, < AS alsuā, calswā, cal swā* (= OS *alsu* = OFries *as, ase, ast, als, alsa* = D *als* = OHG *alsō*, MHG *alsō, also, al so, als*), lit. 'all so,' wholly so, quite so, just so, being the demonstrative adv. so, qualified by the intensive adv. *all*. As a demonstrative, the word retains its full form (see *also*), as a relative or correlative, the word, through weakening of force and accent, has been reduced to *as*. It is thus historically so with an absorbed intensive, whose force has disappeared, and it has all the relational uses of *so*, the difference being only idiomatic. The peculiar form and uses of *as* have arisen out of the correlation *so*—*so* (AS *swā swā*, or, without separation, *swā swā*), in which both terms were orig. demonstrative. The second term passed into the relative use, and the first, remaining demonstrative, was strengthened by the adv. *all* (AS *cal swā* . . . *swā*). The second term, as a relative, became weak in accent, and after assuming the prefix *all* in conformity to the first, was gradually reduced, through *also, als, als, ase*, to *as*, to which, in turn, the first term in many constructions conformed. The resulting correlations *so*—*so*, *as*—*as*, *so*, *as*, through

involvement of uses, transposition of clauses, and ellipsis of one or the other term, extending often to the whole clause, present in mod. E. a complication of constructions which cannot be fully exhibited except at great length, and in connection with the earlier uses. They are also involved with the kindred correlations *such*—*as* (*such* being historically *so*, with an absorbed relational suffix) and *same*—*as*, in which the relative conj. *as* varies with *that*, and leads to the use of *as* as a simple relative pronoun.] I. *adv.* (*demonstrative or antecedent*). The antecedent in the correlation *as*—*so*, or *as*—*as*. In that degree, to that extent, so far. The correlation *as*—*so* is obsolete, *as*—*so* is in extremely common use, being, besides *like*, the regular formula of comparison to express likeness or equality, as, *black as jet*, *as cold as ice*, *as wise as Solomon*, etc., the

verb in the relative clause, when the same as in the principal clause, being usually omitted, as, *it is as cold as ice* (sc. *is*), *come as soon as you can* (sc. *come*).

He was *al so* [var. *also, als, as*] freche as is the moneth of Mai.
Chaucer, *Gen. Prolog.* to C. T., l. 92.

We [Americans] use these words [faith and hope] as if they were as obsolete as Helah and Amen.
Emerson, *Man the Reformer*

The relative clause is often omitted, especially in colloquial speech, being inferred from the antecedent, as, *this will do as well* (sc. *as that*), *I would as lief walk* (sc. *as ride*).

The bad man shall attend as bad a master
Fletcher, *Wife for a Month*, v. 3

I will be temperate

II. *conj.* (*conjunction or relative adv.*) 1. The consequent in the correlations *as*—*as*, *so*—*as*, *such*—*as*, *same*—*as*, etc., expressing quantity, degree, proportion, manner, etc. The relative uses are as exhibited in I. (where see examples). Through ellipsis of the antecedent, it enters into many peculiar idiomatic phrases.

His resolutions were as fained as his vows were frus-trated.

Addison, *Spectator*, No. 291

In parenthetical clauses involving a concession, the relative *as* (the antecedent being omitted) may be equivalent to *though*, as, *late as it was* we set forth on our journey.

Title as the counsel was in this emergency it was to me as if an angel had spoken.
Lamb, *Amicus Redivivus*

Neither the arguments nor entreaties of his friends, backed as they were by the avowed wishes of his sovereign, could overcome his scruples.
Prescott, *Ferd. and Isa.*, ii. 5

In parenthetical clauses involving a contrast or negation as to fact with the principal clause, *as* approaches an adversative *as* use, being nearly equivalent to *but*.

Had I but time, (as this fell sergeant, Death,
Is strict in his arrest,) O, I could tell you,
But it is too late.
Shak., *Hamlet*, v. 2

I must confess I lov'd her, as who would not?
Fletcher, *Loyal Subject*, v. 7

In subordinate clauses involving a supposition, *as* is conditional, being equivalent to *as if*, *as though*, which are the ordinary forms. This use is now rare or only poetical except in the independent phrase *as it were* (see phrases below).

It lifted up its head, and did address
Itself to motion, like as it would speak

And all at once their breath drew in,

Coleridge, *Ancient Mariner*, l. 165

Wordsworth, *Intimations of Immortality*

The clause introduced by *as* may be reduced by ellipsis of its verb and other elements to one or two important words, having *as* as a quasi-connective. (a) Between an adverb or adverbial phrase in the principal clause and an adverb or adverbial phrase constituting the subordinate clause.

It suffices me to say that men here, as elsewhere, are indisposed to innovation.
Emerson, *Lit. Ethics*

(b) Between the principal verb or its subject and the subordinate subject or object, which becomes equivalent to a predicate appositive or facilitative object after the principal

verb, as meaning 'after the manner of,' 'the same as,' 'like,' 'in the character or capacity of,' etc. as, the audience rose as one man, all these things were as nothing to him, he has been nominated as a candidate. Hence in constructions where the appositive clause depends directly upon the noun as, his career as a soldier was brilliant, his reputation as a scholar stands high, and so in naming phases of a general subject as, Washington as a general, man as a thinker. The construction as a quasi predicate appositive, or factitive object after a principal verb is usual after verbs of feeling or regarding.

Evil was embraced for good, wickedness honour'd and esteem'd as virtue. *Milton, Hist. Eng., III*

That law which concerneth men as men. *Hooker, Eccles. Pol.*

This gentleman was known to his contemporaries as a man of fortune, and as the author of two successful plays. *Macaulay*

Our age is bewail'd as the age of Introversion. *Emerson, Amer. Scholar*

The subordinate clause introduced by *as* is often not dependent grammatically upon the principal verb, but serves to restrict or determine the scope of the statement as a whole. Such clauses are parenthetical, and usually elliptical, some of them *as usual* and *as a rule*, having almost the idiomatic unity of an adverbial phrase.

The streets were narrow, as is usual in Moorish and Arab cities. *Irving, Granada, p. 2*

In certain emphatic formulas, *as* ('even as') introduces a solemn attestation ('as truly or surely as') or adjuration ('in a manner befitting the fact that'), approaching a causal sense, 'since, because' (See 2, below).

4. Of purpose or result The consequent in the correlations *so as, such as*. To such a degree that, in such a manner that followed by an infinitive or, formerly, by a finite verb (but in the latter construction that has taken the place of *as*)

5. Of mere continuation, introducing a clause in explanation or amplification of a word or statement in the principal clause, especially in giving examples. For example, for instance, to wit, thus

Winter birds, as woodcocks and fieldfares. *Bacon*

A simple idea is one idea as sweet, bitter. *Locke*

6. In dependent clauses That. Formerly *as* was often attached, like that to the adverbs *there, then, where, when, etc.* to make them distinctly relative. These forms are now obsolete, except *whereas* which remains in a deflected sense. See *whereas*. From this interchange with that followed the use of *as* for *that*, in introducing an object clause after *say, know, think, etc.*, varying with *as that* and *as how* only in dialectal use. *us, I don't know as I do* and *I don't know as I do*, the sense varying with the accent.
